9 M. amphium (Labill. nov. holl. 2. p. 70. t. 220.) leaves opposite, obovate, entire; flowers axillary, solitary. 2. B. G. Native of Van Diemen's Land, in marshes. A creeping herb, with the habit of Callitriche. Flowers monoeous, male ones octandrous.

Amphibious Water-milfoil. Pl. cr.

*** Male flowers hexandrous.

*** Male flowers tetrandrous.

11 M. tuberculatum (Roxb. fl. ind. 1. p. 471.) leaves in whorls, lower ones pinnatifid; spikes almost naked; bracteas oblong, a little toothed at the apex; carpels tubercular, acute on the back. 2. B. S. Native of humid places and on the shores of lakes, near Calcutta. Flowers pink.

Tubercled-fruited Water-milfoil. Pl. fl.

Intermediate Water-milfoil. Pl. fl.

13 M. tetrandrum (Roxb. fl. ind. 1. p. 470.) leaves dis-
posed in whorls, cut into capillary segments; spikes almost leafless; bracteae pinnatifid; carpels smoothish, blunt on the back.

2. W. S. Native of the East Indies, in pools filled by the rain, and where it is called Neelka-pamram by the Telogas. Flowers white.

_Tetrandrous Water-milfoil._ Pl. fl.

14 M. scabra (Michx. fl. bor. amer. 2. p. 190.) leaves in whorls, cut into linear distant lobes; flowers in axillary whorls; bracteae much like the leaves; fruit 8-angled; angles tubercular. 2. W. H. Native of Carolina, Georgia, and North California, in stagnant water. Potamogeton pinnatum, Walt. fl. var. 90. Carpels more closely connected than in any of the other species.

_Scabrous-fruited Water-milfoil._ Pl. fl.

13 M. teneillum (Bigel. fl. bost. ed. 2. p. 346. D. C. prod. 3. p. 69.) stem simple, almost leafless, erect, rooting at the base; leaves scale-formed, alternate, entire; flowers in the axis of the upper leaves, as well as dispersed in interrupted spikes, having the flowers alternate. 2. W. H. Native of North America, in watery places about New Cambridge, and in Newfoundl. Hylas aphyllus, Bigel. mss. M. müllum, Lopylecia.

_Slender Water-milfoil._ Pl. fl.

_Sect. II. PILOPHYLLUM (from πυλος, pylon, a soft feather, and φυλλον, phyllon, a leaf; in reference to the narrow segments of the leaves.)_ Nutt. gen. amer. 2. p. 211.—Turshlia, Rafin. but not of D. C. Flowers all hermaphrodite, tetrandrous. Petals wanting. Anthers roundish. Stigmas minute, pubescent. Leaves alternate.

16 M. ambiguum (Nutt. l. c.) leaves alternate, petiolate, lower ones cut into capillary lobes, upper ones into linear lobes, uppermost ones almost entire or serrated. 2. W. H. Native of North America, in ponds in New Jersey.

Var. a, nütans (D. C. prod. 3. p. 70.) stems floating, dichotomous. 2. W. H. Native of Jersey, New York, floating in water.

Var. b, timulósum (Nutt. l. c.) stem rooting, erect; leaves stiff, almost entire or trifid; lobes setaceous, acute. 2. B. H. Native on the banks of the Delaware, and in New Jersey.

_Ambiguous Water-milfoil._ Pl. fl.

_Cult._ All the species of Myriophyllum being aquatic plants if cultivated should be grown in ponds, in which they may be either planted or the seeds thrown in. Small parts of the tropical species should be taken up in the autumn, planted in a pan of water, and then to be placed in the stove, in order to preserve them in a living state during the winter; and in the course of the April or May next season may again be returned to the pond in the open air, where they will thrive much better than if grown all the year round in pans of water or cisterns in a hot-house. None of the species are, however, worth growing except in botanical gardens.

_Tribe II._

_CALLITRICH'INEÆ (plants agreeing with Callitriche in important characters)._ Link. enum. hort. berol. 1. p. 77. D. C. prod. 3. p. 70. Limb of calyx hardly discernible. Petals wanting. Stamens 1, rarely 2. Fruit 4-celled, 4-seeded (f. 103. c.).—Aquatic herbs, with opposite leaves, and insignificant axillary solitary flowers.

_VII. CALLITRICHÉ (a name given by Pliny to a plant which had the colour of beautiful hair, from καλλος, kallos, beautiful, and ϕρυκτος, phryctos, thrie trichlos, a hair, but the present genus has nothing to do with the plant of Pliny)._ Lin. gen. 13. Lam. ill. t. 5. Gartn. fruct. 1. p. 330. t. 68. A. Richard, diet. class. 3. p. 59. D. C. prod. 3. p. 70.—Stellárias, Dill. gen. p. 119. t. 6, but not of Lin.

_Lin. gen._ Monándria, Monogónia, or Polygónia, Monoceía.

Flowers usually bisexual, monoeccious, with 2 opposite petaloid bracteae at the base of each flower. Styles 2 (f. 103. a.), subulate.—Smooth annual aquatic herbs.

Var. γ, lineáris (D. C. l. c.) leaves all linear, upper ones scarcely obovate, 3-nerved. In ditches about Moscow. Stems short, creeping.

Var. c, stellátula (Hopp. bot. tash. 1792. p. 758.) leaves all ovate-oblong, opaque, stiffish; stems rooting. Native of Thuringia.

Var. 2, tenuisfólia (Pers. ench. 1. p. 5.) leaves all linear, upper ones 3-nerved. In humid, hardly inundated places.

To this polymorphous species the following names probably appertain, viz. C. dioeca, Pentag. inst. bot. 2. p. 10. C. Británia, Pentag. l. c. C. andrógyna or C. hemonaphrodita. Schult.; but these are extremely doubtful.

2 C. pedunculátæ (D. C. fl. fr. ed. 3. no. 3656.) leaves linear, upper ones oblong, 3-nerved; fruit pedicellate; margin of carpels obtuse. O. W. H. Native of France, in stagnant water; also of Scotland, in ditches. Hook. in engl. suppl. 2606. Stalk of fruit from 1 to 3 lines long, upper ones the shortest.

4 C. terregstris (Rafin. med. spec. xii. p. 358.) leaves approximate, short, oblong, obtuse, rather succulent; fruit sessile,

VIII. HIPPURIS (from ἵππος, hypos, a horse, and ὀπορις, opor), a tail; resemblance in stem from the crowded whorls of very narrow hair-like leaves). Lin. gen. no. 11. Lam. ill. t. 5. Gier. fruct. 2. t. 84. Juss. ann. mus. 3. t. 30. f. 3. D. C. prod. 3. p. 71.—Pinaestilla, Dill. nov. gen. 168.

LIN. SYST. Monandria, Monogynia. Style filiform (f. 104. f.), received into the furrow of the anther (f. 104. e.). Fruit crowned by the limb of the calyx. Flowers usually hermaphroditic, but sometimes are found female and neuter from abortion.

1 H. vulgarius (Lin. spec. p. 3.) leaves linear, many in a whorl, usually from 6-12. 2. W. H. Native throughout Europe and North America, in ditches and lakes, in muddy places among grass and weeds. (Edler. fl. dan. t. 87. Smith, engl. bot. t. 763. Drev. et Heyne, pl. cur. t. 93. Poit. fl. par. t. 1. According to Torrey in fl. un. st. 1. p. 2. the Pennsylvanian and Canadian plant does not differ from the European, but the Hudson's Bay one is probably distinct according to Pursh, fl. amer. sept. 2. p. 778. and is probably the H. polyphylla of Rafin. fl. lud. p. 13. Root creeping much.

2 H. MONTANA (Lede. in Rechb. icon. bot. 1. t. 86. no. 181.) plant weak; leaves 7 in a whorl, linear, acute. 4. W. H. Native of the island of Unalaska, in ditches and lakes. H. Eschölizi, Cham. in habit. Habit of a species of Galium. Perhaps only a variety of H. vulgaris.

Mountain Marestail. Pl. 1 foot.

3 H. MARIThA (Hellen. diss. with a figure), leaves linear, obtuse, 4 in the lower whorls, and 5-7 in the upper whorls. 5. W. H. Native of Sweden and Finland, &c. in salt water. Horn. fl. dan. t. 1281. Rechb. t. 86. f. 182. H. lanceolata, Retz. obs. 3. p. 7. t. 1. H. tetraphylla, Lin. fil. suppl. 81. The leaves are much shorter and a little broader than those of H. vulgaris.

Maritime Marestail. Pl. 1 foot.

Cult. Not worth cultivating unless in botanical gardens. The species should be grown in ponds or cisterns of water, if cultivated.

Order XCV. CERATOPHYLLACE (plants agreeing with vol. ii.)

Flowers monocious. Calyx or perigone free, many-particled (10-12); lobes equal. Petals none. Male. Stamens 12-20; filaments wanting; anthers ovate-oblong, 2-celled, sessile, and crowded in the centre of the calyx, furnished each with 2 (f. 105. d.)-3 points. Female. Ovary free, ovate, 1-celled. Stigma sessilis, filiform, incurved, oblique (f. 105. e). Nut 1-celled, 1-seeded (f. 105. b.), indiscenct, terminated by the hardened style. Seeds pendulous. Albumen none. Embryo straight, with a superior radicle, 4 cotyledons in a whorl, which are alternately smaller, and a many-leaved plumule.—Floating herbs, with whorls of multifid cellular leaves (f. 105. f); the segments filiform, and serrated along the edges.

This is a very distinct order, but whose proper station in the natural system is not well known. It agrees with Coniferæ in the many-whorled cotyledons, but the habit is wholly different. In habit it agrees with Myriophyllum on the one hand, and on the other with HIPPURIS, and in many characters with the last, especially in the want of petals, in the 1-celled ovary, in the nucamentaceous fruit, in the solitary pendulous seed, as well as in habit, from the leaves being in whorls, from the axillary sessile, usually unisexual flowers, and in its habitat, but differs in the free ovarium and the many cotyledons.

I. CERATOPHYLLUM (from κερας, keras, a horn, and φυλλον, phyllon, a leaf; in reference to the leaves being bronched, like a stag's horn). Lin. gen. no. 1055. Ger. fruct. 1. p. 211. t. 44. Lam. ill. t. 775. Schkuhr, handb. 3. p. 294. f. 297.—Hydroceratophyllum, Vaill. act. par. 1719. t. 2. f. 2. Dichotophyllum, Dill. gen. p. 91. t. 3.

LIN. SYST. Monocotyl, Polyandria. The character is the same as that of the order, being the only genus.

1 C. DEMERGUM (Lin. spec. 1409.) fruit armed with 3 spines, which are unequal, 1 terminal, and 2 lateral (f. 105. e. d.); segments of the calyx notched at the extremity. 2. W. H. Native of Europe, in ditches and ponds, and all still water; plentiful in some parts of Britain. Smith, engl. bot. t. 947. C. cornutum, Rich. 1. e. Gray, brit. pl. 2. p. 554. Dichotophyllum demergerum, Mouch. math. 345. Vaill. 1. c. t. 2. f. 1. Loes. pruss. t. 12. Leaves dichotomous, somewhat trifid, a little toothed along the lobes, when young crowded. (f. 105.)

2 C. submersum (Lin. spec. 1409.) fruit destitute of spines, but furnished with 2 tuberces at the sides, and the base of the style at the apex; segments of the calyx acute, entire. 2. W. H. Native of Europe, in ditches, ponds, and all still water with a muddy bottom; and of Porto Rico in the West Indies; plentiful in Britain. Oed. fl. dan. 310. Smith, engl. bot. t. 679. Schkuhr, handb. t. 297. C. verrucosum, Rich. 1. c. Gray, 1. c. Leaves rather more divided than those of the first species, and the young ones are less crowded.

4 X
CERATOPHYLLEÆ. I. CERATOPHYLLUM. LYTHERARIEÆ.

3 C. platycanthicum (Cham. in Linnaea. p. 504. t. 5. f. 6. a.) fruit obovate, winged, armed with 3 spines, with a few teeth between the spines; spines elongated, lateral ones flat. Y. W. H. Native of California. C. demersum, Schlecht. fl. berol. p. 486.

Broad-spined Hornwort. Pl. fl.
4 C. oxyacanthium (Cham. in Linnaea. p. 504. t. 5. f. 6. b.) fruit elliptic, compressed, armed with 3 spines; spines terete, elongated. Y. W. H. Native of California?

Sharp-spined Hornwort. Pl. fl.
5 C. obtusatum (Cham. in Linnaea. p. 504. t. 5. f. 6. c.) fruit elliptic, compressed, winged, muricate, armed with 3 spines; spines slender, weak; wing narrow, many-toothed. Y. W. H. Native of Egypt and California? C. demersum, Sieb. pl. Egypt.

Muricate-fruit Hornwort. Pl. fl.
6 C. tuberculatum (Cham. in Linnaea. p. 504. t. 5. f. 6. d.) fruit elliptic, rather compressed, finely tubercled, armed with 3 spines; spines slender, weak; wing none. Y. W. H. Native of the East Indies. C. indicum, Willd. herb. no. 17546. C. demersum, Klein.

Tubercled-fruit Hornwort. Pl. fl.
7 C. appiculatum (Cham. in Linnaea. p. 504. t. 5. f. 6. e.) fruit elliptic, compressed, armed with one spine, and furnished with a tubercle on each side; spine weak; wing none. Y. W. H. Native of Europe. C. submersum, D. Č. and Schkuhr handb. t. 297.

Apiculated Hornwort. Pl. fl.
Cult. The plants of this genus grow in ponds, pools, or ditches, but are not worth cultivating except in botanical gardens.

Calyx monosepalous (f. 106. a. f. 107. a.), with a tubular (f. 107. a.) or campanulate tube; lobes valvate or separate in vestivation, their sinus sometimes lengthened into other lobes (f. 106. b.), which are produced on the outside. Petals variable in number (f. 106. c.), inserted between the lobes of the calyx, very deciduous; sometimes wanting altogether. Stamens inserted into the tube of the calyx below the petals, to which they are sometimes equal in number; sometimes they are twice, thrice, or even 4 times as numerous, but they are very seldom fewer; anthers oval, 2-celled, inserted by the back (f. 106.). Ovarium free, 2 or 4-celled. Style filiform; stigma usually capitellate (f. 106. c.). Capsule membranous, covered by the calyx (f. 106. a.), 1-celled, opening either longitudinally or in an irregular manner. Seeds numerous, small, exalbaceous, adhering to the central placenta. Embryo straight, with the radicle turned towards the hyalon, and the cotyledons flat and foliaceous.—Herbs, rarely shrubs. Branches terete, but most frequently tetragonal. Leaves opposite, seldom alternate, entire, feather-nerved, without either stipules or glands. Flowers axillary, or in spikes or racemes at the tops of the branches. This order is nearly allied to Onagráridæ, from which it is distinguished by the free, ribbed calyx. It is also separated from Melastomeæ in the ovary being free and in the different position of the veins of the leaves.

Astringency is the property of Lythrum Salicaria, which is reputed to have been found useful in invertebrate diarrhoeas; another species of the same genus is reputed, in Mexico, to be astringent and vulnerary. The flowers of Lythrum Huntari are employed in India, mixed with Morinda, for dyeing, under the name of Dhanvy. The Mexicans consider Heimia salicifolia a potent remedy in venereal diseases, and call it Huchinol; its expressed juice, taken in doses of 4 ounces, excites violent perspiration. Lampsíon incenís is the plant from which the hemlock of Egypt is obtained. Women of that country stain the nails of their fingers and feet with it. It is also used for dyeing skins and maroquiins reddish-yellow, and for many other purposes. It contains no tannin. (Edinb. phil. journ. 12. p. 416.) The leaves of Anumánia vesicatória have a strong mucriatic smell, they are extremely acid, and are used by the native practitioners of India to raise blisters in rheumatism, &c.; bruised and applied to the part intended to be blistered, they perform their office in half an hour, and most effectually. (Ainly 2. p. 93.)

Synopsis of the genera.

Tribe I.

Salicarieæ. Lobes of calyx separate or somewhat valvate in vestivation. Petals numerous (f. 106. c). Alternate lobes of calyx at the sinuses formed from the other lobes. Seeds wingless.
3 Suffrænia. Calyx campanulate, 4-lobed, and furnished with a little tooth at each recess. Petals wanting. Stamens 2, inclosed. Capsule 2-valved, hardly 2-celled.
5 Pedlis. Calyx campanulate, 12-lobed, the 6 that rise from the sinuses smaller. Petals 6, small. Stamens 6. Capsule 2-celled.
6 Amannia. Calyx campanulate, 8-14-toothed, those rising from the sinuses the smallest. Petals 4-7, but sometimes wanting. Stamens equal in number to the petals, rarely twice that number. Capsule 4-celled, or when mature 1-celled.
7 Lythrum. Calyx 8-12-toothed, the alternate ones at the sinuses smaller and spreading. Petals 4-6, equal, inserted in the orifice of the calyx. Stamens equal in number, or twice the number of the petals, inserted in the middle or at the base of the calyx. Capsule 2-celled.

13 Diploduson. Calyx bibracteolate at the base (f. 106. a.), 12-lobed (f. 106. b.), those at the sinuses narrowest, the rest triangular. Petals 6 (f. 106. c). Stamens 6-12-18-24-30-36. Capsule 2-valved, 2-celled, but at maturity only 1-celled.

15 De'caden. Calyx campanulate, with 5 erect lobes, and 5 horn-formed ones at the sinuses. Petals 5. Stamens 10, 5 of which are very long. Ovary 3-celled.

16 Nestea. Calyx campanulate, with 4-6 erect lobes, and as many horn-formed ones at the sinuses. Petals 4-6. Stamens 8-12, nearly equal. Ovary 4-celled.

19 Aba'tia. Calyx subturbinate; limb 4-parted. Petals wanting. Stamens about 20, inserted near the base of the calycine tube. Capsule 1-celled, 2-valved, opening at the apex.

TRIBE II.

Lagerstromieae. Lobes of calyx valvate in the bud. Petals the same number as the lobes of the calyx, and inserted at its divisions at the top of the tube. Stamens inserted lower down in the calyx than the petals, twice or thrice the number of the petals. Seeds expanded into a membranous wing.—Shrubs or trees.

† Genera belonging to Lythrariacae, but are not sufficiently known.

Tribe I.

SALICARIEAE (so named from the plants agreeing in habit and character with Lythrum Salicaria, which has received its specific name from its resemblance to Salix in its leaves). D. C. mem. soc. h. n. gen. 3. pt. 2. p. 71. D. C. prod. 3. p. 75. Lobes of calyx more or less separate in aestivation, or somewhat valvate. Petals many, alternating with the lobes of the calyx, and inserted at the top of the tube at the divisions; sometimes wanting. Stamens inserted in the tube of the calyx below the petals. Seeds wingless.—Herbs or shrubs.

1 R. verticillaris (LIN. l. c.) leaves 4-8 in a whorl, linear, acute. O. B. H. Native of the East Indies. En-eapd, Rheed. mal. 9. t. 81. ex Lin. Capsule 3-valved, 3-celled.

Whorled-leaved Rotala. Pl. ½ foot.

Decussate-leaved Rotala. Pl. ½ foot.

3 R. Mexico (Schlecht. et Cham. in Linnaea. p. 567.) leaves 3-4 in a whorl, usually opposite towards the tops of the branches, linear, a little dilated at the base; flowers in whorls; capsule 3-valved, 1-celled. O. W. H. Native of Mexico, in slow running water, near Hacienda de la Laguna.

Mexican Rotala. Pl. 1½ inch.

Cult. Sow the seeds in a warm moist sheltered place in the open border.

II. CRYPTO THECA (κουντός, cryptos, hidden, and θήκη, theca, a cover; capsule hidden by the calyx). Blum. bijdr. p. 1128. D. C. prod. 3. p. 76.

Lin. syst. Didandra, Monogynia. Calyx funnel-shaped, 4-cleft. Petals 4, small, or wanting. Stamens 2, opposite, inserted in the bottom of the calyx; anthers roundish. Style 1, lateral, obtuse. Capsule girded by the calyx, 1-celled, irregularly circumcised at the apex. Seeds numerous.—Suphrenicaceae, branchless herbs from Java, with angular stems. Leaves opposite. Peduncles axillary, many-flowered. This genus agrees with Suphrenia in the number of the stamens, and in the infusion with Amnânnia.

1 C. dichotoma (Blum. l. c.) leaves linear-lanceolate, broadest at the base, half stem-clasping; corymbs dichotomous; flowers 4-petalled. H. B. S. Native of Java, in bogs about Batavia, and on the margins of rivers about Buitenzorg.

Dichotomous Cryptotheca. Shrub 1 foot.

2 C. apecta (Blum. l. c.) leaves on short petioles, lanceolate; peduncles many-flowered; flowers apetalous. H. B. S. Native of Java, on the banks of the river Tjimadie, in the province of Tjaniar. 4 x 2
Apetalous Cryptophaca. Shrub 1 foot.

Cult. These plants will do well in a mixture of loam, peat, and sand, and cuttings will root in sand under a bell-glass. The pots in which the plants are grown should be always kept in pans of water.

III. SUFRENIA (in honour of De Suffren, a French botanist, author of Principes de Botanique, suivi d’un catalogue des plantes de Frioul et de Carnia, 1 vol. 8vo. Venice, 1802), Bell. set. taur. 7. t. 1. f. 1. D. C. prod. 3. p. 76.

Filiforium Sufrenia. Pl. 1/2 to 1 1/2 foot.

Cult. The seed to be sown in wet or marshy ground in the open air.

IV. AMELE'TIA (from αμελετος, ameletoς, neglected. The present genus was formerly included in the genus Pélipis, from its characters having been overlooked). D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 82. prod. 3. p. 76.—Pélipis species of Wild. Lin. syst. Tetrandria, Monogynia. Calyx campanulate-tubular; larger lobes 4, erect, ovate, acuminate, connivent, smaller ones 4, tooth-formed at the sinuses. petals none. Stamens 4, inserted in the tube of the calyx. Ovarium ovate. Style filiform; stigma capitate. Capsule ovate, when young 2-celled, but in the adult state only 1-celled, from the dissepiment having vanished, 2-valved, many-seeded.—An herb with opposite, entire leaves. Spikes axillary, sessile, bracteate. Flowers small, bipartecolate at the base, sessile along the rachis, rising from the axis of the elongated bracteas. This genus is intermediate between Ammánia and Pélipis. The habit is peculiar.

Indian Ameletia. Pl. 1/2 foot.

Cult. The seeds of this plant should be sown thinly in a pot, which should be placed in a hot-bed, and when the plants are about 2 inches high, the pot may be removed to the stove or greenhouse, where the plants will flower and ripen their seed.

V. PÉP' LIS (πεπλος, peploς, the Greek name for the purslane; similar habit). Lin. gen. no. 446. Lam. ill. t. 262. D. C. prod. 3. p. 76.—Pértula, Dill. gen. 7. Glaucescoid, Mich. gen. 18.—Chabrier, Adans. fam. 2. p. 294. but not of D. C.—Glàux, Vaill, bot. p. 80. t. 15. f. 5.

Lin. syst. Ilézandria, Monogynia. Calyx campanulate, with 12 lobes, of which 6 are broader than the rest and erect, the others spreading, subtulate, and rising from the sinuses. petals 6, minute, fugacious, sometimes wanting. Stamens 6, alternating with the petals in front of the broader calyceine lobes. Style hardly any; stigma capitate. Capsule 2-celled, many-seeded. Branched herbs, with opposite or alternate, entire leaves; and sessile, axillary, solitary, insignificant flowers.

1 P. Pértula (Lin. spec. 474.) leaves opposite, obovate, stalked; petals hardly visible; flowers axillary, solitary. B. H. Native of Europe, in watery places, on a sandy, gravelly, or heathy soil, frequent; plentiful in some parts of England. Sclthur, handb. 10. Pl. dan. t. 64. Curt. lond. t. 27. Smith, engl. bot. t. 1211. Pértula diffusa, Mench. Calyx reddish. Petals white, very minute, or wanting.

Two-flowered Water Purslane. Pl. creeping.

3 P. altertnifólia (Biebl. suppl. 277.) leaves alternate, somewhat spatulate. B. H. Native of Caucasus, about the Volga. P. Volgénésis, Fisch. in litt. 1810.

Dinárous Water Purslane. Pl. creeping.

Cult. The species of Water Purslane grow in any soil that is moist, where the seeds may be sown.

Lin. syst. Tetra-Heptandria, Monogynia. Calyx campanulate, with 4-7, erect, flat teeth, and 4-7 horn-shaped, spreading, smaller ones rising from the sinuses. Petals 4-7, alternating with the erect teeth of the calyx. Stamens equal in number to the petals, rarely double that number. Capsule oval-globose, membraneous, 4-celled, or only 1-celled when mature. Seeds numerous, fixed to the central placenta, which is tetragonal.—Smooth aquatic plants. Stems usually tetragonal. Leaves opposite, quite entire. Flowers small, axillary, sessile, or on short pedicels, usually pink or red.

§ 1. Flowers apetalous. Stamens 4. Some of the species are probably placed in this division from the petals being very caduceus.

1 A. parvifóra (D. C. prod. 2. p. 77.) stem erect, tetragonal, glabrous; leaves oblong, sessile; cymes axillary, many-flowered, longer than the leaves; calyx 4-toothed; capsule globose, hardly longer than the calyx. B. F. Native of the East Indies. Herb slender.

Small-flowered Ammannia. Pl. 1/2 foot.

2 A. filifórum (D. C. mem. soc. gen. 3. p. 95.) stem erectish, branched from the base; branches diffuse, filiform, tetragonal; leaves linear; umbels axillary, many-flowered, rather loose, pedunculate; flowers apetalous, tetranundal; capsule globose, exceeding the calyx. B. F. Native of Senegal. Lythrum filiforme, Perr. in litt. Herb weak. 3-4 inches long.

Filiform Ammannia. Pl. ascending.

3 A. Senegalísnsis (Lam. ill. no. 155. t. 77. f. 2.) stem erect, tereete, branched, and floriferous from the base, tetragonal; leaves linear-lanceolate, sessile, dilated at the base, cordate; umbels axillary, many-flowered, on short peduncles; flowers apetalous, tetranundal; capsule globose, twice the
LYTHRÆÆ.

4. **A. indicum** (Lam. ill. no. 1555.) stem erect, branched, terete; branches rather tetragonal, erectish; leaves lanceolate, attenuated at the base; corollas axillary, many-flowered, on short peduncles; flowers apetalous, tetraherous. B. F. Native of the East Indies, and the Island of Timor. Intermediary between the preceding and the following species.

Small-fruited Ammannia. Pl. ¾ foot.

5. **A. microarpa** (D. C. mem. soc. gen. p. 93.) plant erect, branched, terete; branches at the base and tetragonal at the apex; branches spreading; leaves lanceolate, sessile, attenuated at the base; flowers sessile, axillary, crowded, apetalous, tetraherous, disposed in something like whorls. B. F. Native of Egypt, in rice-fields. Del. fl. aegypt. 37. t. 15. f. 3. Calyx acutely 8-toothed. Capsule spherical, when mature 1-celled.

7. **A. vesicatória** (Roxb. fl. ind. 1. p. 447.) stems erect, branched; branches undivided; leaves sessile, lanceolate, attenuated at the base; flowers sessile, axillary, disposed in something like whorls, apetalous, tetraherous. B. F. Native of the East Indies, in humid cultivated fields. Pluk. alm. t. 186. f. 22. Burm. ind. t. 15. f. 3.? A. baccifera, Lin. spec. 173.?

Capsule 1-celled. The leaves have a strong mucrotaceous smell; they are extremely acid, and are used by the native practitioners of India to raise blisters in rheumatism, &c., bruised and applied to the part of the body intended to be blistered; they perform their office in half an hour most effectually.

Blistering Ammannia. Pl. ½ to 1¼ foot.

Hastate-leaved Ammannia. Shrub 1 foot.

9. **A. elatiróides** (D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 92. t. 3. f. B.) stems decumbent at the base; branches erect, filiform, somewhat tetragonal, simple; leaves sessile, all opposite, lower ones oblong, upper ones ovate; flowers sessile, apetalous, tetraherous, nearly all solitary. B. F. Native of Senegal. Lythrum multiflorum, Perr. in litt. Capsule ovate, 4-celled. Calyx cylindric, 4-toothed, with the sinusae scarcely exserted into teeth.

Elatine-like Ammannia. Pl. decumbent.

10. **A. borysthénica** (D. C. prod. 3. p. 78.) stem branched, diffuse; leaves oblong, or obovate-lanceolate, lower ones opposite, upper ones alternate; flowers axillary, sessile, apetalous, and tetraherous, almost always solitary. B. F. Native at the Bosphorus, near Kiew and Kremenchug. Péplis Borysthénica, Bess. ex Spreng. syst. 1. p. 135. Calyx 8-cleft, and the capsule is that of Ammannia.

Bosphorus Ammannia. Pl. diffuse.

11. **A. occidentális** (D. C. prod. 3. p. 78.) stems ascending, rooting at the base; leaves lanceolate, tapering into the petiole at the base; flowers axillary, sessile, apetalous, tetraherous, nearly all solitary. B. H. Native of Porto Rico. Péplis occidentális, Spreng. syst. 2. p. 135. Calyx 8-toothed. Young capsule 4-celled, but the mature capsule is nearly 1-celled, as in Ammannia. Habit of Péplis.

§ 2. **Tetrapétalæ** (from τετρά, tetra, and πεταλο, petal, petals); petals 4.

12. **A. caput-laurei** (Bieb. fl. taur. 2. p. 457. suppl. p. 111.) stems tetragonal, erect, branched; leaves lanceolate, attenuated at the base; flowers axillary, glomerate, sessile, tetraherous; petals 4, small, or wanting. B. H. Native at the river Cyrus, towards the Caspian Sea. Habit of **A. Ægyptiaca**, but the petals are 4, ex Bieb. Like **A. sanguínolenta**, but the teeth of the calyx are more stiff and acute. Flowers purple.

14. **A. latifolia** (Lin. spec. 174.) stems tetragonal, erect, branched; leaves lanceolate, blunted and auriculately coriaceous at the base; flowers axillary, 1-3-together, sessile; petals and stamens 4. B. F. Native of Jamaica, and probably of South Carolina. Sloane, hist. t. 7. f. 4. Lam. ill. t. 77. f. 1. Petals are said to be white. Perhaps the plant is apetalous.

16. **A. verticilílata** (Lam. ill. 1. no. 1554. t. 77. f. 3.) stem erect, tetraherous, branched; leaves lanceolate, nearly sessile, attenuated at the base; flowers crowded in whorls in the axils of the leaves; petals 4, obovate; stamens 4. B. H. Native of marshy places about Padua, and in rice grounds near Florence, and probably also of the East Indies and China. Corenià verticillata, Hardw. spec. 2. p. 9. t. 1. A. indicà, Lam. dict. 9. p. 328. A. baccifera, Lin. spec. 173.? A. viridís, Willd. in Horn. hort. hafn. 1. p. 146. Habit of **A. Ægyptiaca** and **A. vesicatória**, but differs in the flowers being 4-petalled, not apetalous. Calyx 4-toothed. Capsule roundish, equal in length to the tube of the calyx, 1-celled, of an obscure purple colour, ex Hardw.

17. **A. densiflóra** (Roth, nov. spec. 93.) stems ascending, branching, creeping at the base; leaves sessile, linear-lanceolate, rather coriaceous at the base; branches all densely beset with flowers from the base, so much so as to appear spike-formed; bracteas spreadingly recurved; flowers axillary, sessile; petals 4, obovate; stamens 4. B. F. Native of the East Indies. Petals whitish. Capsule subglobose, smaller than the calyx.

Dense-leaved Ammannia. Pl. ½ foot.

18. **A. multiflóra** (Roxb. fl. ind. 1. p. 447.) stems straight, tetraherous; angles acute; leaves linear, dilated and cordately sagittate at the base, stem-clasping; peduncles axillary, 3-7-flowered; petals 4, roundish. B. F. Native about Calcutta, in fields. Petals red. Capsule 1-celled.
Many-flowered Ammannia. Pl. ½ to 1 foot.
19. A. de Bels (Ait. hort. kew, ed. 1. vol. 1. p. 163.) stems angular, branched; leaves lanceolate, attenuated at the base; flowers in axillary fascicles; petals 4, oblongate; stamens 4; capsule bilocular. ♀. B. F. Native of the East Indies. Petals pale purple.

20. A. difflua’s (Wildl. enum. 1. p. 167.) stems ascending, branched, tetragonal at the apex; branches diffuse; leaves lanceolate, bluntish, narrowed at the base, upper ones cordate; corymb axillary, 3-7-flowered, pedunculate; petals and stamens 4. ♀. B. F. Native country and fruit unknown. Petals white.

21. A. cathartica (Schlecht. et Cham. in Linnaea. 2. p. 378.) flowers solitary, sessile, tetrandrous; calyx 8-toothed, outer teeth narrower, longer, erect, about equal in length to the petals, which are fugaceous; capsule ovoid, inclosed, 4, rarely 3-celled; leaves lanceolate, tapering to the base. ♀. B. F.

Var. a. Philippéa (Schlecht. et Cham. l. c.) stem weak, rooting at the base. Native of the Island of Luzon, in moist sandy places.

Var. b. Brasiléa (Schlecht. et Cham. l. c.) stem firm, erect. Universal Ammannia. Pl. ½ foot.
22. A. rotundifolia (Roxb. fl. ind. 1. p. 446.) stems diffuse, creeping at the base, but ascending at the apex; leaves almost sessile, nearly orbicular; flowers nearly sessile, crowded in the axils of the upper leaves, and constituting terminal spikes; petals 4, ovate; stamens 4. ♀. B. H. Native of Nipal, near Katmandu; and of Bengal. D. Don, prod. fl. nep. p. 220. This plant has the appearance of a species of Goniocarpus. Stems 3-5 inches high. Capsule 4-celled. Petals pink.

23. A. pentandra (Roxb. fl. ind. 1. p. 448.) stems creeping at the base, simple, but erect and branched at the apex; branches simple; leaves sessile, lanceolate; flowers axillary, sessile, solitary, 5-petalled, and pentandrous. ♀. B. F. Native of the East Indies, in humid places, and of Java, in rice-fields. Blum. bijdr. p. 1130. Petals purple. Capsule 4-celled, but when mature, almost 1-celled, longer than the calyx.

24. A. naa’na (Roxb. fl. ind. 1. p. 448.) stems creeping at the base, but erect at the apex and branched; branches branched again; leaves sessile, wedge-shaped; flowers solitary, 5-petalled, and pentandrous. ♀. B. F. Native of the East Indies, in marshes. Petals purple. Very like the A. pentandra, but much smaller. Capsule 1-celled.

Dwarf Ammannia. Pl. ½ to 1 foot.

Dodecaandrous Ammannia. Pl. ½ to 1 foot.
26. A. sanguinole’nta (Schwartz, fl. ind. occid. l. p. 272.) leaves linear-lanceolate, acutish, but bluntly and auriculately coriaceous at the base, half stem-clasping; flowers almost sessile, axillary, 3-5-together; petals 4; stamens 8. ♀. B. F. Native of Jamaica, in bogs and ditches; and of Hispaniola and Mexico. Petals blood-coloured. Capsule 4-celled. A. octándra B. Poir. suppl. 1. p. 328.

Auriculate-leaved Ammannia. Pl. 1 foot.

† Species not sufficiently known.
29. A. re’bra (Hamilt. in D. Don, prod. fl. nep. p. 220.) stem erect, almost simple, tetragonal, rooting at the base; leaves oblong, obtuse, sessile; flowers sessile, solitary; fibrous branches oppositely, hardly longer than the leaves. ♀. B. H. Native of Nipal. Stem 3-4 inches high. Petals red.

30. A. rosa’ea (Poir. suppl. 1. p. 328.) stems weak; branches filiform; leaves linear, sessile, acutish, floral ones small; flowers usually solitary, sessile; capsule globose. ♀. B. F. Native of the East Indies. Flowers small, rose-coloured. Plant small.

Rose-coloured-flowered Ammannia. Pl. ½ foot.
31. A. repéns (Rottl. ex Mart. acad. munc. phil. 6. p. 150.) stems rooting, tetragonal; leaves on short petioles, oblong, bluntnish; flowers axillary, solitary, sessile. ♀. B. H. Native of the East Indies.

Creeping Ammannia. Pl. creeping.
32. A. fall’dia (Lehm. sem. hort. hamb. 1823. p. 3.) stem erect, tetragonal; leaves lanceolate, acuminate, dilated and coriaceous at the base; flowers in glomerate whorls. ♀. B. F. Native of the East Indies. From the capsule being 4-corrugated it is probable that this plant ought to be excluded from the genus. It is perhaps a species of Myriophyllum, but differs from that genus in the leaves being scattered.

Pinatifid-leaved Ammannia. Pl. procurant.

Cult. The species of Ammannia being all annuals, and for the most part natives within the tropics, the seeds of them must be sown in pots, which should be placed in a hot-bed frame or in a stove, and when the plants have grown to the height of 2 inches, they may be transplanted into other pots, 3 or 4 plants in each; these pots should be placed in the stove or warm part of a greenhouse, placing each in a pan of water. Some of the plants may also be planted out in the open ground, in a shel-
tered moist situation. None of the species are worth growing, unless in botanic gardens.

1. L. HYSSOPIFOLIA. Calyx cylindrical, striated, with 8-12 teeth, of which from 4-6 are broader than the rest, and erect; the others smaller and spreading. Petals 4-6, inserted in the orifice of the calyx, alternating with its erect middle petals. Stamens inserted in the middle, or at the base of the tube of the calyx, twice as numerous as the petals, or occasionally fewer. Style filiform; stigma capitulate. Capsule oblong, included in the calyx, 2-celled, many-seeded. Placentas thick, adnate to the sepalum.—Herbs, seldom subshrubs. Leaves entire. Flowers axillary, purple or white. Stems square.

1. L. NUMULARIACEUM (Lois. not. p. 74, but not of Pers.) glabrous; stem herbaceous, branched; leaves obovate-roundish, obtuse, opposite, but some of the rameal ones are alternate; flowers axillary, solitary, apetalous. O. H. Native of Corsica. Calyx nearly of Ammannia, 8-16-toothed, the alternate teeth small and horn-formed. Petals wanting, or falling off early. Stamens 4-8, inclosed. Capsule ovate, 2-celled. This plant is an Ammannia in flower, but a Lythrum in fruit.

2. L. hyssopifolium (Lin. spec. 642.) leaves alternate, linear, acutish; flowers almost sessile, shorter than the leaves; bracteas foliaceous, linear, usually longer than the calyx; petals 4-6; stamens 8. O. H. Native of Egypt, Mauritania, and many parts of the south of Europe, in salt marshes by the sea side; and a plant very much resembling the present species, if not the same, was collected about Concepcion in Chili, by Captain Dumont d'Urville.—J. Bauh. hist. 3. p. 792. Barbel. icon. t. 773. f. 2. Pentaglossum linifolium, Forsk. descr. no. 11. Salicárias hyssopifolia, Lam. fl. fr. Stems erect. Flowers small, pale lilac.

Varr. β, major (D. C. prod. 3. p. 81.) stems more branched, elongated; leaves linear-lanceolate. O. B. H. Native about Montpelier. L. bibractéatum, Salzm. in lett. Habit of L. hyssopifolium, but the character is that of L. thymifolium.

6. L. hyssopifolium (Lin. spec. 642.) leaves linear-lanceolate, bluntest; lower ones opposite, upper ones alternate; flowers axillary, solitary, nearly sessile, each with a pair of small bracteas at the base; stamens 6. O. B. H. Native throughout the whole of Europe, also to be found in North and South America, New Holland, and the Cape of Good Hope, where it has probably been introduced; in partially dried up pits or ditches, or places where water has stagnated during winter. In England, on Hounsfield heath; in several parts of Cambridgeshire, Huntingdonshire, Bedfordshire, Oxfordshire, Suffolk, and Worcestershire, but by no means common. Jacq. fl. austr. t. 133. L. hyssopifolium, Smith, engl. bot. t. 292. Hyssopofilia, Bauml. pin. 218. Salicárias hyssopifolium, Lam. Maun. Flowers small, light purple. The L. hyssopifolium, Broth. fl. lus. 2. p. 244. is said by Link to be a distinct species, which he calls L. megnánthum, but the character given by Brotero is too imperfect to decide this point.

Var. β, acutifolium (D. C. prod. 3. p. 82.) leaves acutish. O. H. Native of temperate parts of Europe. L. thymifolium, Hoffm. fl. germ. 1800. p. 213. but not of Lin.

Var. β, virgulísum (D. C. prod. 3. p. 82.) stems suffruticos; flowers on long pedicles. O. H. Native of St. Domingo. L. lineare, Bertero, ined. L. virgatum, Spreng. in herb. Ball. Perhaps a proper species.

Var. α. tenellum (D. C. l. c.) leaves oblong. Native of the Cape of Good Hope. L. tenellum, Thunb. fl. cap. Perhaps a proper species.

7. L. thymifolium (Salzm. ex Schlcht. et Cham. in Linna. 2. p. 356.) stems branched to the apex; branches alternate; leaves lanceolate, obtuse, and as if they were roundly truncate; flowers axillary, each furnished with a pair of bracteas at the base; petals 5; stamens 5; calyx 10-toothed. O. H. Native of the south of Europe. Barrel. icon. 773. f. 2. Flowers purple. Less glaucous than L. hyssopifolium. Parts of flowers quinary.

Three-bracteated Purple-Loosestrife. Pl. 1 foot.

8. L. lancelóatum (Eill. sketch. t. 1. p. 544.) stem branched, suffruticoso at the base, quadrangular, winged; branches diffuse, rather pubescent; leaves opposite, almost sessile, oblong-lanceolate, acutish, glabrous, rounded at the base, with the margins a little ciliated; pedicels axillary, 3-4-together; flowers verticillate, dodecandrous; style inclosed; petals 5-6-7. O. H. Native of Carolina, and probably of Mexico, in marshes and humid places. L. virgatum, Walt. ed. 120. Pursh, fl. amer. sept. 1.
of Murcia; also of Liguria and Mauritania. Flowers rose-coloured. Branches flexuous. Perhaps sufficiently distinct from L. Graeffii.

Flexuous-stemmed Purple-Loosestrife. Pl. ½ to 1 foot.

SECT. III. Salicaria (from Salix, a willow; willow-like leaves). D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 77. prod. 3. p. 82. Stamens twice the number of the petals. Flowers numerous in the axils of the upper leaves, which are degenerated into the form of small bracteas, therefore the flowers appear as if they were in whorls, and racemose spikes.

16 L. Salicaria (Lin. spec. 640.) leaves opposite, lanceolate, cordate at the base; flowers in whorled leafy spikes, almost sessile. 2. H. Native of Europe, in ditches and watery places, especially about the margins of ponds and rivers; plentiful in Britain. Smith, engl. bot. 1061. Curt. lond. fase. 3. t. 28. Pl. flan. 671. Flowers of a variable crimson or purple. Leaves opposite, or 3 or even 4 in a whorl. Stamens 12-14. Petals 6-7. Petal variable with regard to smoothness or pubescence. It is astringent, and is useful in inverte diarrhea.

17 L. Tomentosa (Mill. dict. no. 2.) leaves opposite, ovate, cordate at the base, clothed with white tomentum, as well as the stem and calyces; flowers numerous, in axillary whorls, forming an interrupted leafy spike. 2. H. Native of North America. Flowers finely purpure. Leaves sometimes 3 in a whorl.

18 L. Virgatum (Lin. spec. 642. but not of Walt.) leaves lanceolate, attenuated at the base; panicle twiggy; flowers 3 together, axillary, distinctly pedicellate. 2. H. Native of Tauria, Siberia, Russia, Austria, Germany, and Belgium. Sims. bot. mag. t. 1003. Jacq. austr. t. 7. Salicaria virgata, Meech. L. Austriacum, Jacq. vind. 243. Flowers purple. Plant more loose and glabrous than L. Salicaria.

Var. 6. acuminatum (Willd. spec. 2. p. 866.) racemes terminal, elongated, crowded with flowers. 2. H. Native of Ireland.

† Species not sufficiently known.

19 L. Hunteiri (D. C. prod. 3. p. 83.) leaves opposite; calyx tubular, 6-lobed; petals 6, lanceolate, erect; stamens 12; style subulate; capsule 2-celled, 4-valved. 2. S. Native of the East Indies, where it is called Dhawry. W. Hunt, asiat. res. 4. p. 42. Petals of a beautiful red. The flowers, mixed with those of Morinda, are used for dyeing in India.

Hunter's Purple-Loosestrife. Shrub.

20 L. ? Apostalam (Spreng. syst. 2. p. 454.) stem shrubby; leaves linear, acute, alternate; flowers in whorls, apetalous, hexandrous. 2. S. Native of Brazil. Perhaps a species of Amphilinna.

Apetalous Purple-Loosestrife. Pl. 1 foot.

Lin. syst. Dodecandra, Montagn. Calyx tubular, gibbous at the base on the upper side; limb wide, 12-toothed, with 6 of the teeth erect, and the other 6 small or nearly obsolete, rising from the sinuses of the inner teeth. Petals 6-7, unequal. Stamens Cl-14, rarely 6-7, unequal, inserted in the throat of the calyx. Glans under the ovary thick. Style filiform; stigma simple or rather bifid. Capsule membranous, covered by the calyx, 1-2-celled, at length cleft by the deflexed placenta as well as the calyx. Seeds nearly orbicular, compressed, wingless.

—Herbs or subshrubs. Leaves opposite, rarely in whorls, quite entire. Peduncules interpetiolar, 1-flowered, rarely many-flowered. Flowers usually drooping. Calyx coloured. Petals violaceous or white.

§ 1. *Circeoides* (containing plants whose habit is like that of *Circe’a*). D. C. prodr. 3. p. 85. Stems herbaceous, erect. Racemes somewhat spicate, terminal. Flowers small.

1 C. *micrantha* (H. B. et Kunth, l. c. p. 196.) stem herbaceous, erect, branched, rather pilose; leaves on short petioles, oblong, acute, rounded at the base, scabrous on the margins, rather pilose on both surfaces; pedicels solitary or twin, upper ones disposed in spicate racemes; calyxes rather hispid; petals nearly equal. O. F. Native of South America, on the banks of the river Orinoco near St. Barbara, and at San Carlos de Rio Negro. Petals small, violaceous. Stamens 11. Ovary 3-seeded.

Small-flowered Cuphea. Pl. ½ ft.

2 C. *circeoides* (Smith ex Sims, bot. mag. t. 2901.) stem herbaceous, erect, branched, rather pilose; leaves petioled, ovate, acute, pubescent; racemes terminal; pedicels scattered; calyxes hispid; petals nearly equal. O. F. Native of Brazil, in shady places about Pernambuco. Petals small, violaceous. Petioles nearly an inch long. Bracteoles linear.

3 C. *spicata* (Cav. icon. 4. p. 56. t. 381.) stem herbaceous, erect, branched, rather pilose; leaves petioled, ovate-oblong, acute at both ends, glabrous, with scabrous margins; racemes spicate, axillary, and terminal; pedicels opposite; calyxes hairy; petals unequal. O. F. Native of South America, in many parts. Petals small, pale red. Stamens 12. Dorsal tooth of calyx large. Style villous. Ovarium 40-75-ovulate.

Var. *a. tricarpa* (Schlëcht. et Cham. in Linnaea. 2. p. 358.) hind tooth of calyx large; stem hairy.

Var. *b. ex-tricarpa* (Schlëcht. et Cham. l. c.) hind tooth of calyx a little larger than the rest; stem pubescent.

Spicate-flowered Cuphea. Pl. 1 ft.

4 C. *orinocensis* (Cham. et Schlëcht. in Linnaea, 2. p. 372.) root creeping; stem simple, slender, beset with viscid pubescence and glandular pili; leaves ovate, petiolate, finely denticulated, with a few glandular hairs on the nerves beneath; flowers pedicellate, interpetiolar, opposite; calyx gibbous at the base; stamens 11; style villous; ovary containing about 30 ovula.

7. S. Native of Brazil.

*Marjoram-leaved Cuphea*. Pl. 1½ ft.

5 C. *salicifolia* (Schlecht. et Cham. in Linnaea. 5. p. 569.) stem suffruteceous, erect, glabrous; leaves lanceolate, attenuated at the base, and bluntish at the apex, glabrous; calyx pilose on the inside at the insertion of the stamens; petals 6, unequal, filaments pilose. 7. S. Native of Mexico, on the banks of rivulets near Manantla. Petals purple.

Willow-leaved Cuphea. Pl. 1 ft.

§ 2. *Longiflora* (from *longus*, long, and *flos*, a flower; in reference to the long flowers of the species). D. C. prodr. 3. p. 81. Stem herbaceous or hardly suffruteceous; flowers axillary, disposed in racemose spikes; calyx long, tubular, spurred at the base, not gibbous. Petals small or wanting.

6 C. *Melvillia* (Lindl. bot. reg. t. 532.) stem herbaceous; erect; leaves sessile, lanceolate, attenuated at both ends, scabrous; racemes terminal, simple, many-flowered; petals wanting. 7. S. Native of Guiana, at Essequibo. Melvillia speciosa, Anlers. journ. sce. ex Lindl. Calyx red at the base, and green at the apex. Pollen green.

7 C. *jorulleensis* (H. B. et Kunth, nov. gen. amer. 6. p. 208.) stems herbaceous; branches compressed, clothed with clammy pubescence; leaves oblong-lanceolate, acute, on very short petioles, rounded at the base, stiff, scabrous on both surfaces; pedicels 1-3 together, alternate, racemose at the tops of the branches; calyx clothed with clammy pubescence, 6-toothed. 7. S. Native of Mexico, on Mount Jorullo. Calyx red. Petals wanting. Ovarium 12-14-ovulate. Stamens 11, very unequal, exerted.

Jorullo Cuphea. Pl. 1 to 2 ft.

8 C. *tricolor* (Moc. et Sesse, fl. mex. icon. ined. D. C. prodr. 3. p. 84.) stem herbaceous, erect, pubescent; leaves nearly sessile, oblong, acute; pedicels axillary, disposed in a terminal raceme; calyx puberulous, 6-toothed; petals 6, reflexed. 7. S. Native of Mexico. *Elytrodium* album, Moc. et Sesse, fl. mex. icon. ined. Pedicels 4-6 lines long, somewhat secund. Calyx red, green at the apex. Petals small, white. Stamens 11, hardly unequal, very little exerted.

Tricolor-flowered Cuphea. Pl. 1 to 2 ft.

9 C. *micropter(a) (H. B. et Kunth, l. c. p. 209. t. 531.) stem shrubby, much branched; branches and calyces rather roughish; leaves oblong-lanceolate, acute at both ends, stiff, scabrous; flowers supra-axillary, secund; ovary strumose at the apex; petals 6, minute. 7. S. Native of Mexico. *C. crassifolius*, Moc. et Sesse, fl. mex. icon. ined. Calyx 12-toothed, scarlet, yellowish at the apex. Petals white. Filaments red. Ovarium 2-celled, many-seeded, with a thick lateral gland at the base.

10 C. *verticillata* (H. B. et Kunth, l. c. p. 207. t. 552.) stem herbaceous; branches and calyces hairy; leaves 3 or 4 in a whorl, almost sessile, oblong, acutish, rounded at the base, scabrous from stigmatic, and pilose beneath; flowers extraaxillary, solitary or twin, alternate; petals 5-8, unequal. 7. S. Native of Peru, in hot places. Calyx 10-16-toothed, coloured, with the limb villose. Petals villose.

Whorled-leaved Cuphea. Pl. 1 to 2 ft.

11 C. *lysimachoides* (Schlecht. et Cham. in Linnaea. vol. 2. p. 374.) stem simple, straight, rarely a little branched, scabrous like the rest of the plant, and beset with viscid glandular hairs; leaves lanceolate, acuminate, petiolate, verticillate or opposite;
flowers interpetiolar, verticillate, pedicellate; calyx with a short spur at the base; petals 6; stamens 11; style villous; ovary 3-ovulate. \( \text{L.} \) S. Native of Brazil. Petals rose-coloured.

**Lythmachia-like Cuphea.** Pl. 1 to 2 feet.

12 C. secundiflora (Moc. et Sesee, fl. mex. icon. ind.) stem herbaceous, erect, and branches; as well as the calyces, pubescent; leaves on long petioles, ovate, long-acuminate; raceme terminal, subsessile, short; flowers secund; petals 6, rather unequal, spreading. O. F. Native of Mexico. Herb with the habit of the first section, but the flowers are referrible to the present. Calyx white. Petals violaceous, 2 upper ones the largest.

**Second-flowered Cuphea.** Pl. 1 foot.

13 C. cordifolia (H. B. et Kunth, l. c. p. 206.) stem herbaceous; branches clothed with clammy pubescence; leaves on short petioles, ovate-oblong, acute, coriaceous at the base, with revolute margins, stiff, scabrous on both surfaces; peduncles interpetiolar, alternate, somewhat racemose; calyx hispid, clammy; petals unequal. \( \text{L.} \) S. Native of New Granada. Calyx 12-toothed. Petals 6, violaceous. Stamens 10-12, exerted, unequal. Ovarium 18-30-ovulate.

**Heart-leaved Cuphea.** Pl.

14 C. minutoides (Cham. et Schlecht. Linnaea. 5. p. 570.) branches brachiate, and are, as well as the peduncles and calyces, minutely puberulous; leaves elliptic or lanceolate; pedicels alternate and opposite the leaves, and longer than them; petals 6, minute; stamens 11. O. F. Native of Mexico, in humid places near Mesachya. Calyx 3 lines long.

**Mimulus-like Cuphea.** Pl. \( \frac{1}{2} \) foot.

15 C. cyanaca (Moc. et Sesee, fl. mex. icon. ind. ex D. C. prod. 3. p. 85.) stem herbaceous, erect; branches hispid; leaves opposite, petiolate, ovate-cordate, acuminate, villous on both surfaces; peduncles interpetiolar, alternate, subracemose; calyx rather hispid; petals 2, spatulate, unequal. O. F. Native of Mexico. Nearly allied to the preceding, but differs in the leaves being all opposite, and standing on petioles, almost an inch long. Calyx red at the base, and yellowish at the apex. Anthers and petals purplish blue. Perhaps the petals are only 2 or probably 6, 8 of which may be deciduous.

**Blue-petalled Cuphea.** Pl. \( \frac{1}{2} \) to 1 foot.

16 C. coecr'nea (D. C. prod. 3. p. 85.) stem shrubby, erect, pubescent at the apex; leaves petiolate, coriaceous, acute; peduncles many-flowered, disposed in a terminal panicle; petals oblanceolate, acute, reflexed. \( \text{L.} \) S. Native of Mexico, on the mountains of Tuxila. Lythrum cordifolium, Moc. et Sesee, fl. mex. icon. ind. Calliopsis carpatica. Petals scarlet. Petals and genitails of the same colour.

**Scarlet-flowered Cuphea.** Shrub 1 to 2 feet.

17 C. Llavea (La Llave ex Lexarc. nov. veg. mex. 1. p. 20.) stems numerous, hispid; branches ascending; leaves almost sessile, ovate-lanceolate, striate; pedicels interfoliaceous, erect; petals 2, ovate, large, the rest abortive; stamens 11. \( \text{L.} \) S. Native of Mexico, on the mountains. Petals paler scarlet. Calyx with a greenish front, and with the back and throat purplish brown. Three of the stamens very long.

**La Llave's Cuphea.** Pl. 1 to 2 feet.

18 C. linearoides (Cham. et Schlecht. Linnaea. 2. p. 367.) stem filiform, erect, always with one side pubescent, intermixed with longer glandiferous hairs; leaves nearly sessile, ovate or ovate-lanceolate, acute, with a few glandular pilis on the edges and nerves; flowers interpetiolar, solitary, alternate, pedicellate; calyx furnished with an ascending spur; stamens 11; style glabrous; ovary 3-ovulate. \( \text{L.} \) S. Native of Brazil. Petals 6, violaceous.

**Linaria-like Cuphea.** Pl. 1 foot.

19 C. Bustamont'na (La Llave ex Lexarc. l. c. p. 21.) stems herbaceous, procumbent; branches ascending; leaves ovate-cordate, on short petioles, acuminate, rather hispid; lateral nerves parallel; flower interfoliaceous, pendulous; outer calyx teeth much elongated; petals 6, upper 2 the largest; stamens 8.—Native of Mexico. There are varieties of this plant with violaceous and rose-coloured petals, marked each with a longitudinal purplish line.

**Bustamont Cuphea.** Pl. procumbent.

20 C. tuberosa (Cham. et Schlecht. in Linnaea. 2. p. 372.) root woody, tuberous; stems erect, branched at the apex; branches alternate, rarely opposite; leaves ovate, petiolar, scabrous; flowers pedicellate, interpetiolar, alternate or opposite, forming terminal racemes; calyx with a short spur at the base; petals 6, unequal; stamens 11; style glabrous; ovary 11-18-ovulate. \( \text{L.} \) S. Native of the southern provinces of Brazil. Flowers purplish. Calyx 5 lines long.

**Tuberous-rooted Cuphea.** Pl. 1 to 3 feet.

22 C. glutinosa (Cham. et Schlecht. in Linnaea. 2. p. 363.) plant clammy, pubescent, mixed with longer glandiferous hairs; stem branched at the apex; leaves lanceolate, acute, on short petioles; flowers interpetiolar, pedicellate; calyx with a short spur; petals shorter than the calyx; stamens 6; style villos; ovary 4-15-ovulate. \( \text{L.} \) S. Native of Brazil, common. Petals violaceous.

**Glutinous Cuphea.** Pl. \( \frac{3}{4} \) to 1 foot.

23 C. Balsamôna (Schlecht. et Cham. in Linnaea. 2. p. 363.) stem erect, hispid from glandular spreading pili; leaves opposite, ovate, attenuated at both ends, petiolate, with cartilaginous finely dentilinagous margins, scabrous on both surfaces; flowers pedicellate; calyx short, 6-toothed, with a very short acute spur; stamens 11, inclosed; ovary 5-6-ovulate; style glabrous. O. F. Native of Brazil everywhere in humid places, and of Mexico near Jalapa. Balsamôna Pinto, Vand. fl. lus. et bras. spec. p. 30. t. 4. Petals violaceous. Flowers forming leafy racemes at the tops of the stem and branches; racemes shorter than the leaves, 2-4-flowered, rarely reduced to one flower.

**Balsam Cuphea.** Pl. 1 foot.

24 C. Procumbens (Cav. icon. p. 4. p. 55. t. 380.) stem herbaceous, assurgent; branches procumbent, clothed with clammy villi; leaves opposite, on short petioles, ovate-lanceolate, rather hispid; flowers pedicellate, solitary, deflexed; calyx clothed with clammy pili, 6-toothed; petals 6, ovate, 2 of which are larger than the rest; the two longest stamens are woolly beyond the anthers. O. F. Native of Mexico. Ker. bot. reg. t. 1981. Petals pale purple. Stamens 11, hairy. Calyx purplish, dilated, and greenish at the apex. Petals rose-coloured.

stem herbaceous, erect, clothed with clamyth pubescence; leaves opposite, on short petioles, lanceolate, rather pilose; flowers pedicellate, solitary, deflexed; calyx beset with clammy pilly, 6-toothed; petals 6, obovate, two of which are larger than the rest; the two longer stamens woolly beyond the anthers. O. F. Native of Mexico. H. B. et Kunth, nov. gen. amer. 6, p. 605. Petals violaceous. Very like C. proewinbems, but differs in being erect. Ovarium usually 18-ovulate, ex Kunth. 

_Lanceolate-leaved Cuphea._ Fl. Aug. Sep. Cpt. 1796. Pl. 13 f. 20. C. _equispentala_ (Cav. ioc. 4, p. 57. t. 382. f. 2.) stem herbaceous, ascending, branched, hispid from stiff bristles, as well as the calyx; leaves on short petioles, oval-oblong, attenuated at both ends, ciliated; flowers pedicellate, solitary, spreading; petals 6, obovate, nearly equal; many of the filaments are bearded. O. F. Native of New Spain, in shady humid places, near Salutaviera, and of Mexico near Jalapa. C. nitidula, H. B. et Kunth, nov. gen. 6, p. 206. C. adscendens, Moc. et Sesse, fl. mex. Icon. ined. Petals red.

_Equal-petalled Cuphea._ Pl. ascending. 

_Parsónia's Cuphea._ Pl. prostrate or creeping.

_Parsónia's Cuphea._ Pl. prostrate or creeping.

_Hairy Cuphea._ Pl. 1 foot.

§ 5. _Fruticose_ (from frutex, a shrub; the plants contained in this section are shrubby). D. C. prod. 3. p. 86. _Stems shrubby._ 

_Pedicels alar, 1-flowered. Calyx gibbosus, or furnished with a short spur at the base. Flowers small._

* _Stamens 10._

31 C. _Swartzia na_ (Spreng. syst. 2. p. 453.) stem shrubby, decumbent, rather scabrous; leaves on short petioles, ovate, corolate, acute, wrinkled, scabrous on both surfaces; racemes secund, leafy; calyx pubescent, 10-toothed; petals 5; stamens 10. 2. S. Native of St. Domingo, in woods. Lythrum coriifolium, Swartz, fl. ind. occ. 2. p. 866. Petals blood-coloured, nearly equal. 

_Swartzia Cuphea._ Shrub decumbent. 

32 C. _decandra_ (Ait. hort. kew. 2. edit. vol. 3. p. 151.) stem shrubby, erect, much branched; branches scabrous, compressed at the apex; leaves ovate, acute, ciliated, tapering into the petiole at the base; flowers few, racemose, somewhat secund at the tops of the branches; petals 5-6; stamens 10. 2. S. Native of Jamaica, on the tops of the mountains among rocks. Lythrum ciliatum, Swartz, fl. ind. occ. 2. p. 868. C. decandra and racemosá Jamaicaénis, Spreng. syst. 2. p. 455. Flowers purple. 

33 C. _racemosa_ (Spreng. syst. 2. p. 453.) stems suffruticos, diffuses; leaves ovate, petiolate; racemes terminal; pedicels opposite, long, bracteate; branches and calyces beset with viscid hairs. 2. S. Native of South America. Lythrum racemosum, Mutis in Lin. fl. suppl. p. 250. This species is not sufficiently known, but it is nearly related to C. Swartziâna. 

_Racemose-flowered Cuphea._ Shrub diffuse. 

* * _Stamens 11._

34 C. _serpynllifolia_ (H. B. et Kunth, nov. gen. amer. 6, p. 201. t. 550, but not of Sims,) stem shrubby, procreant; branches elongated, clothed with hispid pubescence, viscid; leaves ovate-elliptic, acute, rounded at the base, strigose on both surfaces, and viscid; flowers interpetiolar, alternate; calyx clammy and hispid; petals 6, unequal. 2. S. Native of Santa Fe de Bogota. Ovarium 7-ovulate. Petals elliptic, purple. _Stamens 11, unequal._

_Wild-thyme-leaved Cuphea._ Shrub procumbent.

35 C. _microphylla_ (H. B. et Kunth, nov. gen. amer. 6, p. 201.) stem shrubby, much branched; branches clamythy and hairy; leaves ovate-oblong, acute, rounded at the base, viscid and rather scabrous; flowers interpetiolar, alternate; calyx clammy, hispid; petals 6, rather unequal. 2. S. Native of Peru, near Ayavaca. Calyx dark purple. Petals violaceous. Filaments 11, villous, purple. Ovarium 9-10-ovulate. 

_Small-leaved Cuphea._ Shrub 3 feet. 

36 C. _scabrida_ (H. B. et Kunth, l.c. 6, p. 203.) stems shrubby, and are, as well as the branches, bifariously pubescent; leaves oblong, acute at both ends, stiff, rather scabrous from strige above, glabrous beneath as well as the calyxes; flowers alternate, interpetiolar; petals 6, rather unequal; stamens 9-11. 2. S. Native of Mexico, at Salamanca. Petals and stamens purple. Ovary 16-ovulate. 

_Scabrous Cuphea._ Shrub 1 foot. 

37 C. _antisphylitica_ (H. B. et Kunth, l. c. 6, p. 202.) stems shrubby, procreant, roughish; branches pubescent; leaves ovate-oblong, acute, rounded at the base, scabrous; flowers alternate; calyx hispid; petals equal; stamens 11. 2. S. Native of South America, where it is called Chiagari, and where it is used by the inhabitants in the cure of syphilitic complaints. Petals violaceous. Stamens villous. Ovarium 4-ovulate. 

_Antisyphilitic Cuphea._ Shrub proc.

38 C. _strigulosa_ (H. B. et Kunth, l. c.) stem shrubby; 4 x 2.
branches and calyces clavate and hispid; leaves ovate-oblong, acute, rounded at the base, scabrous; flowers alternate; petals 6, nearly equal; calyxes 11. S. Native of Brazil. Petals violaceous. Filaments villous. Ovarium 7-8-ovulate.

**Strigillose Cuphea.** Shrub 1 foot.

39 C. denticulata (H. B. & Kunth, l. c. p. 198.) stem shrubby; branches clavate, hairy; leaves lanceolate-oblong, acute, cuneate at the base; sharply and ciliately toothed, glabrous; flowers interpetiolar on the branches, opposite, somewhat racemose; calyces hispid; petals 6, nearly equal; stamens 11, inclosed. S. Native of Cumana, in humid places near St. Fernando. Petals spatulate, 2 superior ones violaceous, the rest white. Filaments villous. Ovarium 10-14-ovulate.

**Denticulately-leaved Cuphea.** Shrub 1 to 3 feet.

40 C. longiflora (H. B. & Kunth, l. c. p. 200.) stem shrubby; branches clothed with glandular hairs; leaves oblong, acute, rounded at the base, scabrous above, and pilose on the nerves beneath; flowers interpetiolar, alternate; calyx hispid; petals 6, nearly equal; calyx 11, inclosed. S. Native of Mexico near Jalapa; and at Loxa in Peru. Petals pale violet. Filaments villous. Ovary 5-6-ovulate.

**Loxa Cuphea.** Shrub 1 foot.

41 C. uttanyi (H. B. & Kunth, l. c. p. 199.) stem shrubby; branches strigose, glandular, obtuse at the base, glabrous above, but beset with strigose pili on the nerves and veins; flowers interpetiolar, alternate; calyx glabrous; petals 6, rather unequal; calyx 11, inclosed. S. Native of Mexico, near Jalapa. Petals pale violet. Filaments villous. Ovary 5-6-ovulate.

**Hyssop-leaved Cuphea.** Shrub 6 feet.

42 C. grandis (H. B. & Kunth, l. c. p. 199.) stems shrubby, procumbent; branches filiform, elongated, and are, as well as the calyces, puberulous; leaves lanceolate, acute at both ends, 1-nerved, glabrous; flowers interpetiolar, alternate; petals 6, rather unequal; calyx 11, inclosed. S. Native on the banks of the Orinoco, near Atures in sandy places. Petals violaceous. Filaments villous. Ovary 3-4-ovulate.

**Slender Cuphea.** Shrub procumbent.

43 C. cordata (Ruiz et Pav. fl. per. prod. p. 119. t. 11.) stem suffruticose; leaves cordate, acute; petals 6, the 2 superior ones roundish and large, the 4 lower ones small, oblong; calyx 11. S. Native of Peru, on hills. Lower leaves coriaceous, upper ones oblong. Branches, peduncles, and calyces clavate. Filaments 11. S. Native of Trinidad. Petals violaceous.

**Cordate-leaved Cuphea.** Shrub 1 foot.

44 C. trinitana (D. C. prod. S. p. 88.) stems suffruticose; leaves ovate, acute at both ends; petals nearly equal, oblong, pedicels axillary, longer than the leaves. S. Native of the Island of Trinidad. C. serpyllifolia, Sims, bot. mag. 2580. but not of H. B. & Kunth. Allied to C. longiflora and C. grandis. Stamens probably 11.

**Trinidad Cuphea.** Fl. May. Clt. 1829. Shrub 1 foot.

45 C. multiflora (Lodd. bot. cab. t. 808.) stem suffruticose, branched; leaves oblong, acute at both ends; flowers alternate, interpetiolar; petals 6, nearly equal, oblong-linear. S. Native of Trinidad. Petals violaceous.

46 C. liguistra (Schlecht. et Cham. in Linnaea. 2. p. 360.) stem shrubby, procumbent; branches extra-axillary, obsolescently tetragonial, clothed with clammy pubescence, interspersed with long, coloured, glandular hairs, as well as the peduncles and calyces; leaves oblong-lanceolate, with rather scabrous edges; flowers interpetiolar, pedicellate, spurless; hind tooth of calyx large; style villous; ovary 18-32-ovulate; petals 6, about equal in length; filaments villous; calyx 11, length of calyx.

**Priest-like Cuphea.** Shrub decumbent 1 foot.

47 C. calophylla (Schlecht. et Cham. in Linnaea. 2. p. 361.) stem shrubby, sparingly branched; branches extra-axillary, when young clothed with short down and longer purplish glandular-pubescent pili, as well as the branches and calyces; leaves elliptic, acute at both ends, on short pedioles, scabrous; racemes compound; flowers alternate, pedicellate, spurless; teeth of calyx nearly equal; style villous; ovary 5-6-ovulate; filaments villous; petals 6, nearly equal. S. Native of Brazil in the province of Rio Janeiro. Petals violaceous, about the length of the calyx.

**Beautiful-leaved Cuphea.** Shrub 1 foot.

48 C. ericoideus (Schlecht. et Cham. in Linnaea. 2. p. 306.) shrub erect, branched; branches filiform, puberulous; leaves sessile, linear or aceros, 3 in a whorl, and imbricated in 6 rows, scabrous, 3-nerved; flowers crowded at the tops of the branches, pedicellate; calyx with a short spur; style glabrous; ovary 3-ovulate; stamens 11, inclosed. S. Native of Brazil. Petals pale purple, nearly equal. Filaments ciliated. Calyx 3 lines long.

**Heath-like Cuphea.** Shrub 1½ foot.

49 C. thyseedoides (Schlecht. et Cham. in Linnaea. 2. p. 368.) smoothish, shrubby; stem filiform, branched, decumbent; branches beset with short hairs on one side; but the stem, leaves, and calyx are furnished with longer glandular-pubescent hairs; leaves sessile, lanceolate, obtuse, a little ciliolate on the margins; flowers interpetiolar, scattered, pedicellate; calyx furnished with a short spur; style glabrous; ovary 8-ovulate; petals 6, nearly equal; stamens 11, villous. S. Native of Brazil. Petals pale violet. Calyx 4 lines long. **Thyne-like Cuphea.** Shrub decumbent.

50 C. ingredia (Schlecht. et Cham. in Linnaea. 2. p. 371.) shrubby, much branched; branches pubescent on one side, but every where beset with long stiff glanduliferous hairs; leaves broadly lanceolate, tapering into the short pediole, with reflexed, rather scabrous edges, rather pilose; flowers interpetiolar, alternate, pedicellate; calyx with a short spur; petals one-half shorter than the calyx; style villous; ovary 10-12-ovulate; stamens 11, villous. S. Native of Brazil. Petals pale violet. Calyx beset with glandular pili. 4-5 lines long. **Ungrateful Cuphea.** Shrub.

*** Flowers with 12 stamens.

51 C. parviflora (Hook. cxot. fl. fil. 151.) stem suffruticose, pubescent; leaves elliptic-lanceolate, tapering into the short pediole at the base, almost quite entire, with somewhat ciliated margins; flowers in terminal racemes; petals 6, oblong, nearly equal; stamens 12. S. Native about Demerara. Petals rose-coloured. Stamens short, inclosed. Branches clothed with glandular pubescence.

52 C. hirtella (H. B. et Kunth, nov. gen. amer. 6. p. 137.) stem shrubby; branches hairy; leaves oblong, acute, cuneate at the base, viscid, hairy; flowers subracemose at the tops of the branches, opposite; calyx clothed with clammy hairs; petals 6, unequal; stamens 12, inclosed. S. Native of New Granada, near Guatavita. Petals white. Ovarium 10-seeded.

**Hairly Cuphea.** Shrub 1 foot.

53 C. fruticosa (Spreng. neu entd. 2. p. 150.) stem shrubby, branched, diffuse; branches and calyces clothed with clammy hairs; leaves pediately, linear-lanceolate, glabrous; flowers in loose racemes; calyx 6-toothed; petals 6; stamens 12. S. Native of Brazil. Petals violaceous. **Shrubby Cuphea.** Shrub 1 foot.
LYTHRARIEÆ. VIII. CUPHEA. IX. ACISANTHERA. X. FATIOA. XI. PEMPHIS. XII. HEINIA. 717

54. **C. floribunda** (Lehm. sem. hort. hamb. 1831.) shrubby; branches very hispid, elongated; leaves ovate-oblong; peduncles interpetiolar; petals equal; stamens 2, elongated; style very smooth; ovary many-seeded. *S.* Native of Mexico.

**Bundled-flowered Cuphea.** Shrub 1 to 2 feet.

† *Species not sufficiently known.*

55. **C. bractea** (Lag. nov. gen. et spec. hort. madr. 1814. p. 16. no. 212.) stem shrubby, beset with retrograde, spreading hairs; leaves ovate, acute, somewhat undulated; flowers solitary, interfoliaceous. *S.* Native of New Spain. Perhaps the same as *Lytthrum Tuxtlense*, Moc. et Sesse, fl. mex. ined.

**Bracteate Cuphea.** Shrub 1 foot.

**Ciliated-leaved Cuphea.** Shrub.

57. **C. flava** (Spreng. nov. prov. 14.) stem shrubby; leaves cordate-lanceolate, revolute, quite glabrous; flowers terminal, somewhat racemose; calyx striated, 6-toothed. *S.* Native of Brazil. Petals yellow.

**Yellow-flowered Cuphea.** Shrub.

58. **C. fruticulosa** (Schrad. ill. pl. bras. in Gott. anz. 1821. p. 715.) stem suffruticos, branched; leaves petiolate, elliptic-ovate, acute, glabrous above, hairy on the margins and the veins beneath; racemes terminal, few-flowered. *S.* Native of Brazil. *C. fruticosus*, Neuw. res. bras. no. 31.

**Shrubby Cuphea.** Shrub.

59. **C. corymbifera** (Neuw. res. bras. 1821. p. 302.) stems herbaceous, diffuse, clothed with clamy pubescence above; leaves ovate-oblong, on short petioles, roughish; flowers terminal, corymbose. *S.* "Native of Brazil, along the banks of rivers."

**Corymb-bearing Cuphea.** Pl. diffuse.

60. **C. megapotamica** (Spreng. syst. append. 192.) stem herbaceous, simple, glabrous; leaves opposite, linear-lanceolate; corymbs terminal, few-flowered; calyx glabrous. *S.* Native of Brazil, at Rio Grande.

**Rio Grande Cuphea.** Pl. 1 foot.

61. **Apanacto** (Herm. mex. 353. f. 2.) Native of Mexico. Nothing is known of this plant.

**Apanacto** Cuphea. Pl.

**Cult.** Some of the species of *Cuphea* are very elegant when in flower. They grow well in a mixture of loam, sand, and peat; and cuttings of the perennial-herbaceous, and shrubby kinds root freely in the same kind of earth. The seeds of annual kinds require to be raised on a hot-bed.

**Lin. syst. Decandria, Monogynia.** Calyx ventricose, 5-cleft, the sinuses never drawn out into other segments. Petals 5. Stamens 10; anthers sagittate, variable. Capsule covered and crowned by the calyx, roundish, 2-celled, with 2 placentas, many seeded.—An herb, with opposite leaves. Flowers alternate, axillary, solitary. This genus differs from *Rhêxia* in the quinary parts of the flower, not quaternary, in the cells of the capsule being 2, not 3-4, and in the form of the anthers.

1. **A. quadrata** (Juss. in Poir. suppl. 1. p. 111.) *S.* Native of Jamaica, in meadows. P. Browne, l. c. t. 22. f. 1. 

**Square-branched Acisanthera.** Fl. July, Sept. Cht. 1804. Pl. 1 to 1 1/2 feet.

**Cult.** See *Cuphea* for culture and propagation.

X. FATIOA (this genus is dedicated to Nicolas Fatio de Duilliers, a physician of Geneva, who was one of the first who wrote on thermometers, and he was also the first who proposed inarching the branches of fruit trees. Compare Haller. bibl. bot. 2. p. 43.). D. C. prod. 3. p. 88. D. C. coll. mem. 10. t. 2.

**Lin. syst. Leucandra, Monogynia.** Calyx bracteate at the base, campanulate, 6-cleft; lobes triangular, valvate in activation. Petals 6, inserted at the top of the tube of the calyx, and alternating with the calyces lobes. Stamens 24, inserted in the bottom of the calyces tube. Ovary 3-celled. Style filiform, longer than the stamens. Stigma simple. Fruit unknown.—Tree or shrub. Branchlets tetragonal, glabrous, rising in fascicles from the nodes of the branches, or in whorls. Leaves opposite, oval, white beneath, quite entire. Peduncles axillary, 3-5-flowered.

1. **F. nipaule** (D.C. l.c.) *S.* Native of Nipanil. Leaves glabrous and dark green above, but white from short velvety down beneath.

**Nipanil Fatio.** Shrub.

**Cult.** See *Heinia* for culture and propagation, p. 718.

XI. PEMPHIS (from *pephtm, pemphis*, a blister, which the globular form of the capsule represents). Forst. gen. t. 34. Juss. gen. 331. D. C. prod. 3. p. 89.—*Lytthrum species* Lin. and Lam.

**Lin. syst. Dodecandria, Monogynia.** Calyx turbinate, permanent, 12-furrowed; lobes 12, the inner ones erect, and the outer ones or those produced from the sinuses smaller and spreading. Petals 6, ovate, inserted at the top of the calyx tube, and alternating with the larger or erect lobes of the calyx. Stamens 12, inserted in the middle of the calyx tube, alternately smaller. Ovary globular. Style short. Stigma capitata. Capsule membranous, 6-valved, 3-celled at the base, cucumined, filling the calyx. Seeds numerous, fixed to the central placenta, which is tridentate.—A canescent shrub. Leaves opposite, quite entire. Pedicels axillary, solitary, bibracteate at the base. Flowers white.

**Acidulus Pemphis.** Shrub.

**Cult.** See *Heinia* for culture and propagation, p. 718.

**Lin. syst. Dodecadendria, Monogynia.** Calyx bracteate at the base, campanulate, 12-toothed, the 6 inner teeth longest and erect, and the 6 outer ones, or those produced from the sinuses, small, spreading, and horn-formed. Petals 6, alternating with the erect inner lobes of the calyx. Stamens 12, nearly equal, exserted. Capsule nearly globose, covered by the calyx, 4-celled, rarely only 3-celled from abortion, 4-valved, opening at
LYTHRAREÆ. XII. HEINA. XIII. DIPLUSODON.

the cells. Seeds wingless, numerous.—Smooth American shrubs. Peduncles 1-flowered. Flowers yellow.

1 H. salicifolia (Link et Otto, 1. c. t. 28.) leaves opposite or 3 in a whorl, but the upper ones are usually alternate, on short petioles, lanceolate, acute, tapering at the base; flowers pedicellate; capsule ovoid. t. F. Native of Brazil; and Mexico on the declivities of the burning mount Jorullo. Sweet, fl. gard. 281. Nesæa salicifolia, H. B. et Kunth. Ginoria flava, Moc. et Sesè, fl. mex. icon. ined. Chrysòlisa salicifolia, herb. Willd. Lythr um flavum, Spreng. syst. 2. p. 454. Flowers yellow. Petals roundish-ovate.

2 H. myrtifolia (Hort. berol. ex Schlecht. Linnaea. 2. p. 347.) leaves nearly opposite or alternate, lanceolate, acute, smaller than those of H. salicifolia; flowers nearly sessile; capsule globose. t. F. Native of Brazil, in the Island of St. Catharine, at the entrance to Rio Janeiro. Lythr um apetalum, Spreng. syst. 2. p. 454. Flowers yellow.

4 H. syphilitica (D. C. prod. 3. p. 89.) leaves alternate, erect, crowded, linear-lanceolate, attenuated at both ends; petals obovate-oblong. t. F. Native of Mexico, at Yechipil xia, where it is called Hanchinol by the inhabitants. Ginoria syphilitica, Moc. et Sesè, fl. mex. icon. ined. This plant is said to possess powerful antisyphilitic properties; its expressed juice, taken in doses of 4 ounces, excites violent perspiration and secretion of urine, and is said to cure venereal disorders in an incredibly short space of time.

Syphilitic Heina. Shrub 4 to 6 feet.

Cult. The species of Heina are very pretty shrubs when in flower; they only require to be sheltered from frost in winter; this may be done by masts, if the plants are planted against a south wall in the open ground; and if in pots they should be placed in the greenhouse. Cuttings of them strike readily either in sand or mould under a hand-glass.

XIII. DIPLUSODON (from diplos, diploos, double, and ὄς os, ὄς os, os, os, a tooth; a double row of teeth in the calyx). Pl. bras. I. p. 82. Friedländia, Schlecht. et Cham. in Linnaea. 2. p. 348.—Dubæa, D. C. diss. ined. 1827. —Nesæa species of Kunth.

Lin. syst. Dodecandria, Monogynia. Calyx bicraterate at the base, hemispherically campanulate (f. 106. a.), 13-nerved; limb 12-cleft (f. 106. b.), the 6 inner segments largest and erect, and the 6 outer ones, or those from the sinuses, smaller. Petals (f. 106. c.), inserted in the calyx tube, and alternating with the erect segments of the calyx. Stamens 12-36, equal, inserted in the lower part of the tube of the calyx, exserted. Capsule globose, covered by the calyx, 2-celled, 2-valved, many seeded. Seeds oval, compressed, girded by an obscure thickish wing.—Shrub s, with quite opposite decussate entire leaves, and racemously paniced inflorescence.

1 D. hexa'hider (D. C. prod. 3. p. 94.) glabrous; branches terete; leaves oblong-linear, with revolute edges, obtuse, on short petioles; flowers on short pedicels; bracteas oblong; stamens 6? t. S. Native of Brazil, in the province of Minas Geraes. Friedländia hexandra, Mart. herb. Habit nearly of Hypérica angustifólium. Floral branches short, opposite, and slender. Petals reddish-purple. Stamens probably 12.

Hexadromous Diplusodon. Shrub 1 to 2 feet.

2 D. angustifólius (D. C. l. c.) quite glabrous; branches rather tetragonal, slender; leaves linear, with revolute edges, hardly 1-nerved, obtuse, rather coriaceous; pedicels short; bracteas ovate-oblong; stamens? t. S. Native of Brazil, in the province of Minas Geraes. Friedländia angustifólius, Mart. herb. Habit almost of Hibbertia angustifólius. Stem much branched. Leaves 3-4 lines long, hardly a line broad, greyish as well as the calyces. Petals and stamens unknown.

Narrow-leaved Diplusodon. Shrub 1 foot.

3 D. candollei (Pohl, herb. ex D. C. l. c.) branches somewhat tetragonal; under sides of leaves as well as the calyces clothed with adpressed villi; leaves almost sessile, linear, 1-nerved, with revolute margins; flowers on short pedicels; bracteas ovate, acute, longer than the tube of the calyx; stamens 12.? t. S. Native of Brazil, in the province of Minas Geraes. Habit of a bush. Stem much branched. Like D. angustifólius, but easily distinguished from that plant by the hairs on the leaves and calyces. Leaves 3 lines long, but hardly a line broad.

De Candolle’s Diplusodon. Shrub 1 foot.

** Leaves 3-nerved; lateral nerves marginal, rising from the base. Outer calyceine teeth erect.

4 D. epíloboídes (D. C. prod. 3. p. 94.) smoothish; branches nearly terete; when young as well as the leaves, white from fine, short, velvety down; leaves on short petioles, oblong-linear, with somewhat revolute edges, 1-nerved, or the larger ones 3-nerved; pedicels 3-times shorter than the leaves; bracteas linear; stamens 12-15. t. S. Native of Brazil, in the province of Minas Geraes. Friedländia epíloboídes, Mart. mss. Petals of a rose-purple colour. Habit of Epíphedrum Dodoné. Willow-herb-like Diplusodon. Shrub 1 to 2 feet.

5 D. punctatus (Pohl, pl. bras. I. p. 89. t. 72.) quite glabrous, branches rather tetragonal, slender; leaves sessile, lanceolate, marginate, rather doted, somewhat coriaceous; bracteae lanceolate, glabrous; stamens 12. t. S. Native of Brazil, in the province of Goyaz. Corolla bluish-red. Pairs of leaves remote, 6 lines long and 2 broad. Outer calyceine teeth tubercle-formed.

Dotted-leaved Diplusodon. Shrub 1 foot.

6 D. thymifólius (D. C. prod. 1. c.) branchlets tetragonal; both surfaces of leaves and calyces rather downy; leaves almost sessile, oblong, obtuse, 3-nerved, the lateral nerves almost marginal; pedicels shorter than the leaves; bracteas oblong, obtuse, shorter than the calyce tube; stamens 12. t. S. Native of Brazil, in the province of Minas Geraes, in the dry fields near Tojueco, at the height of 3000 feet. Friedländia thymifólius, Mart. herb. Petals rose-coloured. Leaves 2-3 lines long and 1 broad line.

Thyme-leaved Diplusodon. Shrub 1 foot.

*** Leaves feather-nerved, rarely feather-veined.

7 D. virágatus (Pohl, pl. bras. 1. p. 90. t. 75.) glabrous; branches tetragonal; leaves nearly sessile, lanceolate, attenuated at the base; bracteas oblong, glabrous; pedicels short; stamens 18. t. S. Native of Brazil, in the provinces of Minas Geraes and Goyaz. Friedländia albiflora, Mart. herb. Leaves 8-9 lines long, and 5-4 broad. Flowers white.

Twiggy Diplusodon. Shrub 4 feet.

8 D. myrsmítes (D. C. l. c.) quite glabrous; branches tetragonal; leaves ovate or oblong; acute, narrowly at the base, with the lateral veins nearly obsolete; pedicels much shorter than the leaves; bracteas ovate-oblong, obtuse; stamens 12. t. S. Native of Brazil, in the province of Minas Geraes.
LYTHRARIÆ.

XIII. DIPLOSDON.

719

Myrtle-like Diplododon. Shrub 1 to 2 feet.

9 D. vaccinifolius (D. C. I. c.) quite glabrous, much branched; branches rather tetragonal; leaves sessile, lower ones coriaceous, broadly ovate, upper ones oval, all 1-nerved, the lateral veins being hardly discernible; flowers nearly sessile; bracteas oval; calyx of 5 petals, outer ones slightly reflexed; stamens 15. F. S. Native of Brazil, in the province of Minas Geraes. Friedländeria vaccinifolia, Mart. herb. Flowers violaceous. Branches, leaves, and calyces reddish. Leaves 4-8 lines long, lower ones rather ciliated.

Whorly-herby-leaved Diplododon. Shrub 1 to 2 feet.

10 D. amoensus (D. C. I. c.) glabrous; branches bluntly tetragonal; leaves petiolate, lanceolate, obtuse, with revolute, scabrous margins, with 2 nerves only on each side; flowers pedicellate; bracteas spatulate-lanceolate; lobes of calyx spreading; stamens 12. F. S. Native of Brazil, at Chepada and Barbacena. Friedländeria amoeâna, Cham. et Schlecht. in Linnaea. 2. p. 350. Flowers yellow, like those of Helianthea salicifolia, disposed in leafy racemes.

Pleasing Diplododon. Shrub 1 to 2 feet.

11 D. bixifolius (D. C. I. c.) glabrous; branches acutely tetragonal; leaves nearly sessile, ovate, coriaceous, with smooth margins, having 3 nerves on each side; flowers almost sessile; bracteas elliptic-lanceolate, ciliated, shorter than the calyx; stamens 12. F. S. Native of Brazil. Friedländeria bixifolia, Cham. et Schlecht. in Linnaea. 2. p. 351. Inner calyceal teeth erect, outer ones reflexed. Leaves petiolate.

Box-leaved Diplododon. Shrub 1 to 2 feet.

12 D. parvifolius (D. C. I. c.) branches somewhat tetragonal; leaves and calyces hairy from stiff, short, crowded down; leaves sessile, subcordate, roundish, coriaceous, with revolute edges, having 3 nerves on each side, which are hairy beneath; flowers almost sessile; bracteas roundish, shorter than the calyx when in flower, deciduous; stamens 12. F. S. Native of Brazil, in the province of Bahia, at Sincora. Friedländeria parvifolia, Mart. herb. Leaves 3-4 lines long and 2 lines broad. Flowers small, red. Outer calyceal teeth reflexed.

Small-leaved Diplododon. Shrub 1 to 2 feet.

13 D. helianthemifolius (D. C. I. c.) branches tetragonal, rather velvety; leaves oval-oblong, attenuated at the base, on short petioles, the margins rather revolute, velvety beneath from short siphetole down, having 2 or 3 nerves on each side; flowers almost sessile; bracteas ovate, rather shorter than the calyceal tube; calyx glabrous; stamens 12. F. S. Native of Brazil, on Serro Frío. Friedländeria helianthemifolia, Mart. herb. Petals red. Superior leaves 7-8 lines long and 2 lines broad, standing on petioles, a line long.

Sun-rose-leaved Diplododon. Shrub 1 to 2 feet.

14 D. pempoïdes (D. C. I. c.) branches tetragonal, pube
erulous; leaves ovate, sessile, not attenuated at the base, rather scabrous above, but velvety from siphetole down beneath, having 2 or 3 nerves on each side; flowers almost sessile; bracteas oval, deciduous; calyx glabrous; stamens 12. F. S. Native of Brazil, in mountain fields, at Serro Frío. Outer segments of calyx reflexed. According to Martius this plant is only a variety of the preceding, but differs especially from that species in the leaves being half stem-clasping at the base, not attenuated.

Penny-like Diplododon. Shrub 1 to 2 feet.

15 D. serpyllifolius (D. C. I. c.) branches tetragonal, hairy; leaves oval-obovate, on short petioles, glabrous above, but vil

lous on the margins and on the veins beneath; flowers almost sessile; bracteas elliptic-obovate, villous beneath on the margins; calyx villous; stamens 12? F. S. Native of Brazil, in the province of Minas Geraes. Leaves flat, 4-8 lines long, Calyx very villous at the apex before the flowers expand, not as in D. microphyllus, naked. Outer calyceal segments short, subulate, and somewhat spatulate. Petals elliptic, narrowed at the base, apparently white.

Wild-thyme-leaved Diplododon. Shrub 1 to 2 feet.

16 D. microphyllus (Pohl, pl. bras. 1. p. 93. t. 76.) leaves ovate, on short petioles, acutish, ciliated, glabrous above, but pilose on the veins beneath; bracteas oblong, bluntish, having one pilose line on the back as well as being ciliated; stamens 12. F. S. Native of the province of Minas Geraes. Branches tetragonal, hairy. Corolla pale yellow.

Small-leaved Diplododon. Shrub 2 feet.

17 D. hirtellus; hairy; branches tetragonal; leaves almost sessile, elliptic-spatulate, glabrous above, and hairy beneath, having 2-3 nerves on each side; bracteas elliptic-spatulate, ciliated, and with a hairy line on the back; calyx pilose; outer segments of calyx reflexed; stamens 12. F. S. Native of Brazil, in the province of Minas Geraes. Friedländeria hirtella, Cham. et Schlecht. in Linnaea. 2. p. 352. Friedländeria villousula, Mart. herb. Flowers violaceous.

Rattler-hairy Diplododon. Shrub 1 to 2 feet.

18 D. olivaceus (D. C. I. c.) plant canopyous from hairs; leaves almost sessile, elliptic, or ovate, obtuse, hairy on both surfaces, rather revolute at the edges, with 4-5 nerves on each side; flowers almost sessile; bracteas elliptic; outer calyceal teeth reflexed; stamens 12. F. S. Native of Brazil. Friedländeria olivacea, Cham. et Schlecht. in Linnaea. 2. p. 352. Friedländeria verrucofolia, Mart. herb. Petals violaceous. Stamens 24 or perhaps more.

Hairy Diplododon. Shrub 1 to 2 feet.

19 D. lanceolatus (Pohl, pl. bras. 1. p. 98. t. 81.) branches nearly terete, the whole plant scabrous from short downward; leaves on short petioles, lanceolate, acute, scabrous above and rather pilose, but hairy beneath, having 5 nerves on each side; flowers sessile; bracteas ovate, ciliated, pilose; stamens 36. F. S. Native of Brazil, in the province of Goyaz. Corolla greyish red.

Lanceolate-leaved Diplododon. Shrub 2 feet.

20 D. altissimus (Pohl, pl. bras. 1. p. 97. t. 80.) the whole plant clothed with short stiffish down; branches nearly terete; leaves on short petioles, oblong, acute, alutaceous rough above, rather tomentose beneath, with rough ciliated edges, having 6 nerves on each side; bracteas ovate tomentose; flowers sessile; outer calyceal teeth erect; stamens 24. F. S. Native of Brazil, in the province of Goyaz. Leaves nearly 2 inches long and 10-12 lines broad. Corolla greyish red.

Alutaceous Diplododon. Shrub 2 feet.

21 D. scaber (Pohl, pl. bras. 1. p. 96. t. 79.) branchlets compressed, rather scabrous; branches and stems terete and glabrous; leaves on short petioles, oblong, acutish at both ends, scabrous from dots above and from hairs beneath, having 5 nerves on each side; flowers sessile; bracteas obovate, narrowed at the base, ciliated; outer calyceal segments erect; stamens 24. F. S. Native of Brazil, in the province of Goyaz. Leaves an inch long and 5-6 lines broad. Corolla greyish-red, small.

Scabrous Diplododon. Shrub 1½ foot.

22 D. nitidus (D. C. prod. 3. p. 94.) plant quite glabrous; branches acutely tetragonal; leaves petiolate, ovate, bluntish, coriaceous, having 5-6 nerves on each side; floral leaves oblong; pedicles 1-flowered, bibracteolate in the middle; bracteas linear; outer teeth of calyx short, reflexed; stamens 12. F. S. Native of Brazil, between the provinces of Bahia and Minas Geraes. Friedländeria nitiata, Mart. herb. Lower leaves an inch long. Flowers reddish-purple, disposed in leafy racemes.

Shining-leaved Diplododon. Shrub 1 to 2 feet.
23 D. ovatus (Pohl, pl. bras. 1. p. 95. t. 69.) quite glabrous; branchlets compressed, at length terete; leaves sessile, ovate, acute, glabrous, feather-nerved; flowers on short pedicels; bracteas lanceolate, glabrous; outer teeth of calyx spreading; stamens 16. \( \text{F} \text{. S. Native of Brazil, in the province of Minas Gerais. Leaves broad. Corolla greyish red.} \\
\text{Ovate-leaved Diplusodon. Shr. 1 foot.} \\
24 D. oblongus (Pohl, pl. bras. 1. p. 95. t. 78.) quite glabrous; branchlets acutely tetragonal; leaves on short petioles, oblong, quite glabrous, having 4-5 veins on each side, which are reddish beneath; flowers sessile, much shorter than the floral leaves; bracteas oblong, with rather ciliated edges; stamens 15. \( \text{F} \text{. S. Native of Brazil, in the province of Goyaz, in dry fields. Corolla greyish red.} \\
\text{Oblong-leaved Diplusodon. Shr. 3 feet.} \\
25 D. ramoni-simius (Pohl, pl. bras. 1. p. 94. t. 77.) glabrous, much branched; branchlets opposite, compressed to terete; leaves on short petioles, coriaceous, oblong, ciliated, pilose above and glabrous beneath, having 5 veins on each side; rameal and floral leaves smaller, and almost sessile, triple-nerved; flowers on short pedicels; bracteas lanceolate, glabrous; outer calycine teeth erect; stamens 16. \( \text{F} \text{. S. Native of Brazil, in the province of Goyaz, in dry fields. Corolla greyish red.} \\
\text{Leaves more than 2 inches long and 1 broad. Much-branched Diplusodon. Shr. 3 feet.} \\
26 D. strigosus (Pohl, pl. bras. 1. p. 88. t. 71.) plant hest with hispid villi; branchlets compressed, at length terete; leaves sessile, ovate, or oblong-elliptic, acutish, rounded at the base, ciliated, strigose, having 7-8 nerves on each side; flowers almost sessile; bracteas roundish-elliptic, pilose; calycine teeth nearly equal; stamens 24-30. \( \text{F} \text{. S. Native of Brazil, in the province of Goyaz. Calycine lobes beset with cilia. Corolla bluish red. Leaves 3 inches long and 2 broad. Strigose Diplusodon. Shr. 3 feet.} \\
27 D. villulosus (Pohl, pl. bras. 1. p. 91. t. 74.) stem and branches villous; branchlets tetragonal; cauli leaves on short petioles, upper ones oblong-ovate, acute, ciliated, villous above and striigose beneath, having 3-4 nerves on each side; flowers almost sessile; bracteas oblong-elliptic, villous, much shorter than the calyx, which is also villous; outer teeth of calyx reflexed; stamens 15-18. \( \text{F} \text{. S. Native of Brazil, in the province of Minas Gerais. Corolla bluish red. Leaves 9 lines long and 4 broad. Habit of D. lythroides. Villous Diplusodon. Shr. 2 feet.} \\
28 D. lythroides (D. C. prod. l. c.) stem and branches terete, hest with short spreading villi; leaves sessile, broadly ovate, acutish, villous, having 4-6 nerves on each side; flowers almost sessile, aggregate in the axils of the leaves; bracteas ovate, acutish, shorter than the tube of the calyx, which is villous; outer calycine segments erect; stamens 12, rarely 15. \( \text{F} \text{. S. Native of Brazil, in the province of Minas Gerais. Friedlandia lythroides, Mart. herb. Leaves vary from opposite to 3 in a whorl. Flowers large, rose-coloured, sometimes verticillate. Var. \( \text{F} \text{. glabrescens (D. C. l. c.) branches rather hairy; leaves glabrous above, hairy beneath on the nerves and on the calyxes. Petals deep purple.} \)
\text{Imbricate-leaved Diplusodon. Shr. 2 feet.} \\
29 D. villosissimus (Pohl, pl. bras. 1. p. 94. t. 77.) stem and branches terete and villous; cauline and rameal leaves on short petioles, ovate, acutish, cordate at the base, ciliated, clothed with white villi; bracteas oblong-ovate, tomentose; stamens 18. \( \text{F} \text{. S. Native of Brazil, in the province of Minas Gerais. Corolla bluish red.} \\
\text{Very villous Diplusodon. Shr. 1\frac{1}{2} foot.} \\
30 D. stachyoides (D. C. l. c.) herbaceous? hairy; stem or branches tetragonal; leaves on short petioles, ovate, rather cor- date, acute, having 5 nerves on each side; flowers on short pedicels; bracteas rhomboid-ovate, acute, length of calycine tube; outer teeth of calyx erect; stamens 16. \( \text{F} \text{. S. Native of Brazil. Friedlandia stachyoides, Cham. et Schlecht. in Lin- nan. 2. p. 353. Flowers purplish.} \\
\text{Stachys-like Diplusodon. Pl. 1 foot.} \\
31 D. floribundus (Pohl, pl. bras. 1. p. 87. t. 70.) branches terete, rather pilose; leaves sessile, ovate, acute, cordate at the base, pilose, having 4 nerves on each side, rising from the base of the middle nerve; flowers nearly sessile; bracteas ovate, acute, pilose; stamens 24; outer calycine teeth erect. \( \text{F} \text{. S. Native of Brazil. In the province of Goyaz. Flowers bluish red. Leaves an inch long and 6-7 lines broad.} \\
\text{Bundle-flowered Diplusodon. Shr. 1 to 2 feet.} \\
32 D. divaricatus (Pohl, pl. bras. 1. p. 84. t. 67.) plant smoothish, and rather glaucous; branches terete; leaves sessile, roundish-ovate, cordate at the base, glabrous, prunose, with purplish edges; nerves 3-6 on each side, rising from the lower part of the middle nerve; flowers pedicellate; bracteas ovate; outer calycine teeth short and spreading; stamens 30. \( \text{F} \text{. S. Native of Brazil, in the province of Goyaz. Corolla purple. Leaves 2 inches long, and 12-13 lines broad. Di- varicate Diplusodon. Shr. 1 foot.} \\
33 D. margina tus (Pohl, pl. bras. 1. p. 83. t. 66.) quite glabrous; leaves sessile, ovate, or roundish-ovate, cordate at the base, glabrous, prunose, with purplish edges; nerves 3-6 on each side, rising from the lower part of the middle nerve; flowers pedicellate; bracteas ovate; outer calycine teeth short and spreading; stamens 30. \( \text{F} \text{. S. Native of Brazil, in the province of Goyaz. Corolla purple. Leaves 2 inches long, and 12-13 lines broad. Marginate-leaved Diplusodon. Shr. 2 feet.} \\
34 D. imbricatus (Pohl, pl. bras. 1. p. 85. t. 68.) glabrous; leaves sessile, ovate, acutish, cordate at the base, glabrous, prunose, dotted when examined by a lens; imbricated; having 4 nerves on each side, rising from the lower part of the middle nerve; pedicels 1-flowered, shorter than the leaves; bracteas oval-elliptic; teeth of calyx reflexed; stamens 18. \( \text{F} \text{. S. Native of Brazil, in the province of Goyaz. Corolla purple. The nerves of the leaves almost agree with those of the following division of the genus.} \\
\text{Imbricate-leaved Diplusodon. Shr. 2 feet.} \\
35 D. glaucaceus (D. C. l. c.) quite glabrous; branches terete; leaves sessile, cordate, orbicular, hardly apiculated, coriaceous, palmately 7-nerved; pedicels shorter than the leaves; bracteas ovate, shorter than the tube; outer calycine teeth linear; stamens 12. \( \text{F} \text{. S. Native of Brazil, on mountains at Serro Frío, Itambe, &c. in the provinces of the mines. Allied to D. rotundifolius, but is easily distinguished by the smaller bracteas. Leaves 10-11 lines long and 8-9 broad. Glaucescent Diplusodon. Shr. 1 to 2 feet.} \\
36 D. rotundifolius (D. C. l. c.) quite glabrous; branches terete; leaves sessile, cordate, orbicular, palmately 7-nerved,
LYTHRUM (E. XIII. DIPLADOSON. XIV. PHYSOCALYMNIA. XV. DECADON. XVI. NESEA. XVII. CRENEA. 721

crowded, coriaceous, pilose; pedicels shorter than the leaves; bracteas broadly ovate, a little longer than the tube of the calyx; outer calycine teeth linear; stamens 12. *. S. Native of Brazil, in the province of Minas Geraes. Friolidania rotundifoila, Mart. ms.; Leaves longer than the internodes. Petals apparently white from the dried specimen. Bracteas large.

Round-leaved Diplodoson. Shrub 1 to 2 feet.

Shady Diplodoson. Shrub 1 to 2 feet.

Cult. All the species of Dipladoson are very elegant when in flower, but none of them have yet been introduced to our gardens. However, should they ever be, we would advise their being grown in a mixture of loam, peat, and sand, draining the pots in which they are planted well with sherds; they will be easily propagated by cuttings, like other plants of the same order. Judging from the elevated situations in which they naturally grow in the provinces of the mines in Brazil, we should imagine that many of them will stand in the open air in warm sheltered situations, especially against a south wall, at least they will be sufficiently hardy to stand as greenhouse plants, although we would recommend, on their first introduction, that they be treated as stave plants, until their hardiness be ascertained.

XIV. PHYSOCALYMNIA (from φωσ, πηγα, a bladder, and καλυμμα, θαλάμα, a covering; in reference to the inflated bracteas, which inclose the flower before expansion). Pohl in flora, 1827. p. 152. with a figure, and pl. bras. 1. p. 99. tt. 92. 93. D. C. prod. 3. p. 89.

L. syt. Icosandria, Monogynia. Calyx bibracteolate at the base, campulate, inflated, 8-toothed, without any teeth from the sinuses. Petals 8, oval, with undulate crenated margins, inserted in the top of the tube of the calyx. Stamens 24, rising from the base of the calyx beneath the germ. Ovary globose. Style filiform, exserted; stigma capitate. Capsule globose, probably 1-celled.—A tree, with red wood. Leaves oval, quite entire, scabrous, somewhat plicate at the apex, feather-nerved, pilose on the veins beneath. Panicle large, spreading, thyrsoid, with opposite branches. Bracteas glabrous, roundish, mucronate, concave, inclosing the flower-bud before expansion. Calyx purplish. Corolla purplish red.

1 P. floribunda (Pohl, pl. bras. 1. p. 100. tt. 92, 93.). *. S. Native of Brazil in the province of Goyaz. Leaves opposite, decussate, on short petioles. Flower-bud inclosed by 2 inflated bracteas before expansion. The flowers resemble those of a species of LAGERSTROMIA. The wood is rose-coloured, and much esteemed by cabinet makers. It is the celebrated rose-wood of commerce. In this German wood is called Rosenholz. In the province of Goyaz in Brazil Ceega machado; in the province of Rio Janeiro Paod de rosa; and in England rose-wood.

Bundle-flowered Physocalyymna or Brazilian Rose-wood. Tree 26 to 30 feet.

Cult. This tree is most splendid when in flower. It has not yet, like the species of the last genus, been introduced to our gardens. The treatment recommended for the species of Dipladoson will answer this tree also.

XV. DECADON (from δεκα, δέκα, ten, and όδος όδοντος, a tooth; in reference to the 10 teeth of the calyx).

L. syt. Decadria, Monogynia. Calyx hemispherically campulate, bracteate at the base, 10-toothed; inner 5 teeth erect, outer 5 or those from the sinuses spreading and horn-formed. Petals 5, alternating with the inner teeth of the calyx. Stamens 10, 5 of which are very long. Ovarium sessile, almost globose, 3-celled. Capsule covered by the calyx. Seeds minute, wingless.—A downy North American herb. Leaves opposite, or 3 in a whorl. Peduncles 3 or many-flowered, furnished with 2 bracteas at the origin of each pedicel. Petals purple.

Cult. See Lythrum for culture and propagation, p. 713. It is a pretty border-plant when in flower.

L. syt. Octo-Decadria, Monogynia. Calyx hemispherically-campulate, bracteate at the base, 8-12 lobed; the inner 4 or 6 lobes erect, and the outer 4-6 or those from the sinuses spreading and horn-formed. Petals 4-6, alternating with the erect lobes. Stamens 8-12, nearly equal. Ovarium sessile, almost globose, 4-celled. Capsule covered by the calyx. Seeds minute, wingless. Herb glabrous. Peduncles 3-flowered, furnished with 2 bracteas at the origin of each pedicel. Petals blue.

1 N. tenuifolia (H. B. et Kunth, nov. gen. amer. 5. p. 191. in a note). 2. B. S. Native of the Mauritius, in humid grassy places, not of America, as had been formerly supposed. Lythrum trilatrum, Lin. fil. suppl. p. 249. exclusive of the country. Lythrum trianthis, Vent, herb. Trsula trianthis, Comm. herb. Willem, herb. maur. 3. with an excellent description. Leaves opposite, oblong-lanceolate, obtuse or acute, on short petioles. Flowers 3, on short pedicels, on the apex of the peduncle. Corolla blue.

Cult. See Dipladoson for culture and propagation.

L. syt. Tetradria, Monogynia. Calyx urceolate, 4-cleft; lobes broad, triangular, but none produced above the sinuses. Petals 4, inserted between the lobes of the calyx. Ovarium roundish, Style filiform. Stigma oblong. Capsule 1-5-celled, covered by the calyx, many-seeded. Seeds very minute.—Hers or subshrubs. Leaves opposite, glabrous. Peduncles axillary, 1 or many-flowered. Flowers white. In the capsules examined by Aublet they were 5-celled, but in those examined by Meyer and De Candolle, only 1-celled at maturity. Perhaps the capsules are 4-8-celled at first, but as they become more mature the disseipments vanish, and the capsule becomes therefore 1-celled.

1 C. mari'tima (Aubl. guian. l. e. t. 209.) stem nearly herbaceous, nodose; branches tetragonal; angles winged; leaves ovate-oblong; peduncles many-flowered. 2c. B. S. Native of 4Z
Cayenue, in saltish water by the sea-side. Pedicels 1-4, disposed in a kind of umbel at the top of the peduncle. Flowers white.

_Sea-side Crennea._ Pl. 2 to 3 feet.

2 C. repens (Meyer, l.c.) stem suffruticoso, creeping; leaves spatulate; peduncles 1-flowered. H. B. S. Native of Guiana, in the island of Arowanasch, in sandy places inundated by the sea. Flowers white.

_Creeping Crennea._ Shrub creeping.

_Cult._ Should either of the species of _Crennea_ be ever introduced to the gardens, we would recommend their being grown in sand, kept moist by salt water, or the pots in which they are grown may be placed in pans filled with salt water.

_Lin. syst._ Octaldris, Monogynia. Calyx 4-parted, spreading, permanent, having no teeth or lobes produced at the sinuses. Petals 4, alternating with the lobes of the calyx, obovate, unguiculate, spreading. Stamens 8, approximating by pairs, which alternate with the petals. Ovarium sessile. Capsule hard, dehiscing, or a membranous berry, 4-celled, globose. Seeds angular, numerous in the cells.—A smooth shrub. Leaves quite entire. Flowers white, disposed in panicles or corymbs. _Lawsonia aconitacea_ of Lin. fil. or more properly _Aerocynhia ledeus_ of Forster, is a genus that does not belong to this order. It has been referred to _Aurantheae_ by Labillardiere in sert. austral. cal. p. 66.

1 L. _alba_ (Lam. dict. 3. p. 106.) leaves opposite, lanceolate, quite entire; flowers in panicles. H. S. Native of the East Indies, Levant, and north of Africa, where it is frequently cultivated in gardens. _Cypris_ of the ancients. _Henna_ or _Alhenna_ of the Arabs. Alcaén, Rumph. amb. 4. t. 17. Maill-Anschi, Rhed. mal. 1. p. 73. t. 40. L. inermis and _L. spinosa_, Lin. spec. 4. p. 498. L. inermis, Desf. at. 1. p. 325. Young trees unarmed. Old trees having the branches hardened into spines. Flowers white. The powdered leaves, made into a paste, are much used by Egyptian women to dye their nails yellow, which they esteem an ornament. The colour lasts for 3 or 4 weeks before there is occasion to renew it. The plant is supposed to possess vulnerary and astringent properties.

_White-flowered Lawsonia._ Ch. 1752. Shrub 6 to 10 feet.

† _Species not sufficiently known._

2 L. _falcata_ (Lour. coch. 222.) leaves scattered, falcate, rather crenate; flowers corymbose. H. G. Native of Cochinchina, among bushes. Flowers white in racemose terminating corymbs. Berry 4-celled, many-seeded, but frequently 2-3 or 1-celled only. Leaves with a strong ungrateful smell.

_Falcate-leaved Lawsonia._ Shrub 6 feet.

3 L. _coecata_ (Smith, in Rees' cyc. 20. no. 3.) branches spinaceous; leaves elliptico-obovate, acute; lobes of calyx twice the length of the tube. H. S. Native of Banda.

_Scarlet Lawsonia._ Shrub.

_Cult._ The species of _Lawsonia_ thrive well in a mixture of loam and peat; and cuttings strike root readily in sand, with a hand-glass over them, in heat.

XX. ANTHERYLUM. XXI. DODECAS. XXII. GINORIA.

_Lin. syst._ Eicosandra, Monogynia. Calyx with a short, somewhat turbinated tube, having the throat beset with numerous hairs; limb 4-parted; lobes lanceolate. Petals none. Stamens about 20, inserted near the base of the calyxic tube; filaments flat, glabrous. Ovary globose, 1-celled, very villous. Style terete. Stigma small, truncate, pruinose. Capsule 1-celled, 2-valved, many-seeded, opening at the apex; valves placental in the middle. Placenta at length free, convolute at the base. Seeds small, angular, convex on one side, furnished with a small wing-like crest at the apex.—Shrubs clothed with fascicles of cinnereousomentum. Leaves opposite, petiolate, simple, crenated. Flowers racemose. Pedicels 1-flowered, solitary, or in fascicles, each propped by a bracteate. This genus was formerly placed in the order Biziaceae before its relationship was well known.

1 A. _rugosa_ (Ruiz et Pav. l. c.) leaves wrinkled above; anthers oblong. H. S. Native of Peru, on cold hills at Rondon, Piliao, and Nanyan. At Piliao it is commonly called _Taucce-taueca._

_Wrinkled-leaved Abatia._ Shrub.

2 A. _farviflora_ (Ruiz et Pav. l. c. fl. per. et chil. 5. t. 463.) leaves flat above; anthers roundish. H. S. Native of Peru, about Muna, where it is also called _Taucce-taueca._

_Small-leaved Abatia._ Shrub.

_Cult._ See _Lawsonia_ for culture and propagation, p. 722.

_Lin. syst._ Dodecadria, Monogynia. Calyx 4-parted, equal; the sinuses not produced into other lobes. Petals 4, alternating with the lobes of the calyx, and hardly longer than them. Stamens 12-16, inserted in the bottom of the calyx. Ovarium sessile, ovate. Style filiform. Capsule many-seeded, ovate, 3-4-sidetd, 3-4-valved, and when young 3-4-celled; but in the adult state dehiscet, and bearing at the apex a 3-4-angled thick placenta.—A glabrous tree. Leaves opposite or alternate, ovate, quite entire. Spines 2, under each leaf, similar to spiny pulvinii. Pedicels axillary, numerous, 1-flowered, crowded in fascicles. This genus is probably more nearly allied to _Legnostis_, a genus belonging to _Rhizophoreae._

1 A. _Rorin_ (Vahl. l. c.). H. S. Native of the islands of St. Thomas and Porto Rico.

_Rohr's Antheryllum._ Tree.

_Cult._ See _Lawsonia_ for culture and propagation, p. 722.

_Lin. syst._ Dodecadria, Monogynia. Calyx 4-cleft; tube urceolate; lobes deltoid; the sinuses not produced into other lobes. Petals 4, almost orbicular. Stamens 12; filaments adnate to the tube of the calyx a long way. Anthers oblong, adnate. Style flexuosus, obtuse. Capsule globose, half 4-valved, 1-celled. Central placenta stipitate, many-seeded.—A shrub, with tetragonal branches. Leaves opposite, obovate-oblong, quite entire. Pedicels axillary, usually 1-flowered, broadcitate.

_Cult._ See _Lawsonia_ for culture and propagation, p. 722.

XXII. GINORIA (so named by Jacquin in honour of the Marquis Carlo Ginori, who had a botanic garden near Florence, kept up by his son Lorenzo). Jacq. amer. p. 148. t. 91. D. C. prod. 5. p. 91.—Ginória, Lin. gen. no. 603. Lam. ill. t. 407.—_Genória_, Pers. ench. no. 1184.

_Lin. syst._ Dodecadria, Monogynia. Calyx campanulate, permanent, 6-cleft; lobes lanceolate, acuminate, spreading; the sinuses not produced into other lobes. Petals 6, roundish, on long claws. Stamens 12; anthers reniform. Style subulate.
Capsule roundish, 4-valved, 4-furrowed, 1-celled? opening from the apex. Seeds small, inserted in a large, roundish placenta.

1 G. America (Jacq. l. c.).  ʔy. S. Native of Cuba, on the banks of the rivers, where it is called by the inhabitants *Rosa del Rio* or *River-rose*. Flowers nearly an inch in diameter, with a red calyx and blue corolla. Capsule dark red.

*American Ginoria.* Shrub 3 to 4 feet. 

*Cult.* An elegant plant when in flower. Its culture and propagation is the same as that for *Lawsinia*, p. 722.

**XXIII. ADENARIA** (from *ad*, *aden*, a gland; in reference to the petals, calyces, and ovary being beset with glandular dots).  H. B. et Kunth, nov. gen. amer. 6 p. 185.  D. C. prod. 3. p. 91.—Argyrol in specimen, Spreng. syst. 2. p. 474.

**Lin. syst. Octo-Deciadria, Monogynia.** Calyx turbinate, campanulate 4-5-crested; the sinuses not produced into other lobes. Petals 4–5, unguiculate, inserted between the lobes of the calyx. Stamens 8–10, inserted in the base of the calyx, exserted. Ovarium stipitate, 2-celled. Style incised; stigma 2-lobed. Fruit globose, half covered by the calyx, probably indehiscent. Seeds angular, very numerous.—American trees. Leaves opposite, quite entire, beset with glandular dots beneath, as well as on the calyces, petals, and ovary. Flowers white, disposed in axillary umbels.

1 A. criseleoides (H. B. et Kunth, l. c.) branches nearly terete, finely hairy; leaves oblong, acuminated, membranous, glabrous; umbels on short peduncles. ʔy. S. Native of South America, on the banks of the river Magdalena, near Badilla. Antherium crisceleoides, Spreng. l. c. Leaves like those of *Grisea secunda*. Petals spotted with red or brown glands like the rest.

*Grisea-like* Adenaria. Tree 20 feet.

2 A. purpurata (H. B. et Kunth, l. c.) branches terete, when young puberulous; leaves oblong, acuminated, purplish, glabrous, but puberulous on the nerves and veins beneath; umbels almost sessile. ʔy. S. Native of New Granada, on the banks of Smith's and Quilquasa rivers; and at Guayaquil. Antherium purpuratum, Spreng. l. c.

*Purplish-leaved* Adenaria. Tree 20 to 30 feet.

3 A. floribunda (H. B. et Kunth, l. c. p. 188. t. 549.) branches tetragonal, clothed with canescent pubescence, as well as the under side of the leaves, but the upper surface is quite glabrous; leaves oblong-lanceolate, acuminated; umbels on short peduncles. ʔy. S. Native along with the preceding species. Antherium floribundum, Spreng. l. c.

*Bundle-flowered* Adenaria. Tree 20 feet. 

*Cult.* See *Lawsinia* for culture and propagation, p. 722.

**Lin. syst. Octo-Dodecadria, Monogynia.** Calyx coloured, tubular (f. 107. a.), 8-12-toothed; the 4 or 6 inner teeth erect; and the 4 or 6 outer ones, or those produced from the sinuses, horn-formed and smaller. Petals 4-6, oblong, unguiculate, inserted in the top of the calycine tube, between the inner teeth of the calyx. Stamens 8–12 (f. 107. c.), exserted, inserted in the base of the calyx. Capsule globose, inclosed in the calyx. —Shrubs. Leaves opposite, quite entire, dotted with black glands beneath. Pedicels axillary, many-flowered. Flowers red.

1 G. secunda (Loefl. flin. p. 245. H. B. et Kunth, nov. gen. amer. 6 p. 185.) branches glabrous; leaves on short petioles, puberulous on both surfaces, but paler beneath; flowers usually with 4 petals and 8 stamens. ʔy. S. Native of South America, between Cumana and the Orinoco, and near Caracas. Perhaps the plant of Loebling, who says the leaves are glabrous, the calyces 4-toothed, and the flowers secund, is the same as that of Humboldt, who says that the leaves are puberulous, the flowers axillary, and calyx 8-toothed. Perhaps both plants have 5 petals and 10 stamens in the flowers. Calyx greenish. Petals hardly conspicuous, flesh-coloured. Stamens long, purple.

2 G. tomentosa (Roxb. cor. l. p. 29. t. 31.) branches pubescent; leaves sessile, clothed with hoary tomentum beneath, but smooth above; flowers usually with 6 petals and 12 stamens. ʔy. S. Native of the north of Coromandel, on hills (Roxb.), China (Lin.), and the islands of Timor and Java. Ker. bot. reg. 30. Lythrum fruticosum, Lin. spec. 611. Woodfordia floribunda, Salisb. par. Lond. t. 42. Calyx and stamens red. Petals hardly conspicuous. (f. 107.)

*Tomentose* Grislea. Fl. May, Ju. Cl. 1804. Sh. 2 to 6 ft.

3 G. purpureata (Hamilt. ex Smith in Rees' cyclop. vol. 17. no. 2.) leaves petiolate, lanceolate, smooth; branches and flowers erect; calyx 4 times longer than broad; petals 6; stamens 12. ʔy. S. Native of the East Indies. Flowers red. Alabastra turbinate.

*Dotted* Grislea. Shrub.

*Cult.* Pretty shrubs and profuse flowerers. Their culture and propagation is the same as that for *Lawsinia*, p. 722.

**Tribe II.**

**LAGERSTRÆMIAE** (plants agreeing with *Lagerstroemia* in important characters). D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 70. Lobes of calyx exactly valvate at aestivation. Petals numerous, alternating with the calycine lobes, and inserted at the top of the calycine tube between its lobes. Stamens inserted lower down in the calycine tube than the petals, and twice or thrice their number. Seeds expanded into membranous wings.

—Trees or shrubs.

**XXV. LAGERSTRÆMIA** (so named by Linnaeus from Magnus Lagerstræm of Gotenburg, who procured many curiosities from China, and gave them to the public). Wild. spec. 2. p. 117. D. C. prod. 3. p. 93.—*Lagerstroemia* and *Muncheistis*, Lin. gen.

**Lin. syst. Icosiadria, Monogynia.** Calyx bibracteolate at the base, 6-crested; lobes distinct, but none produced from the sinuses. Petals 6, unguiculate. Stamens 18–30. Capsule 8–6-valved, girded by the calyx, 3–6-celled.—East Indian trees, and shrubs. Branches tetragonal. Leaves opposite, quite entire. Peduncles axillary, usually constituting panicles or racemes at the tops of the branches. Flowers purple, red or white, showy.

**Sect. I. LAGERSTRÆMIA** (see genus for derivation). Lin. gen. no. 687. Calyx neither arrowed nor plaited. The 6 outer stamens longer and thicker than the rest.

1 L. yndica (Lin. spec. 784.) leaves roundish-ovate, acute, glabrous; panicle many-flowered, terminal; petals curled on 4 ± 2.
LYTHRARIÆE. XXV. LAGERSTREMIA. XXVI. LAFOENSIÆ. XXVII. PHYSOPODIUM.

Indian Lagerstremia. Fl. Aug. Oct. Cilt. 1759. Shrub 6 to 10 feet. 2 L. parviflora (Roxb. cor. 1. p. 47 t. 66.) leaves oblong or oval, obtuse, rather scabrous; peduncles axillary, 3-6-flowered; petals flat, short claws. ½ S. Native of the mountains called the Circars, in the East Indies. The peduncles being numerous at the tops of the branches, may be called a panicle. The flowers are small and white. The wood is used for various economical purposes in its native country. Leaves downy beneath.

Small-flowered Lagerstremia. Cilt. 1818. Sh. 6 to 12 feet.

Shewy Lagerstremia. Tree.

4 L. grandiflora (Roxb. hort. beng. p. 38.) leaves ovate, cordate at the base, acuminate at the apex, glabrous on both surfaces; pedicles subcorymbose, terminal; petals ovate-oblong, on short claws. ½ S. Native of the East Indies, at Chittagong. Calyx large, cleft into 5 parts beyond the middle. Petals an inch long. Style compressed, thick, exserted. D. C. mem. hist. nat. gen. S. pt. 2. p. 84.

5 L. reginae (Roxb. cor. 1. p. 46. t. 65.) leaves oblong, glabrous; pedicile terminal; calyxes tomentose; petals orbicular, undulated, on short claws. ½ S. Native of the East Indies, in woods on the Circars, and in Java; also of Malabar, in sandy or stony places. Adambæa glabra, Lam. l. c.—Rheed. mal. 4. tt. 20, 21. Flowers large, nearly 2-3 inches in diameter, of a beautiful rose-colour in the morning, growing deeper through the day, until they become purple in the evening. Angles of branches winged.

Queen’s Lagerstremia. Cilt. 1792. Tree 20 feet.

6 L. hirsutæ (Willd. spec. 3. p. 1178.) leaves oblong, pubescent; pedicile corymbose, terminal; petals flat, oval. ½ S. Native of Malabar, on the mountains. Rheed. mal. 4. t. 22. Adambæa hirsuta, Lam. dict. 1. p. 29. Flowers red.

Hairy Lagerstremia. Shrub.

7 L. floribundæa (Jack, mal. misc. 1. no. 2. p. 38.) leaves nearly opposite, ovate-oblong, glabrous; pedicile terminal, much branched, many-flowered, clothed with rusty villi; stamens unequal; calyx tubinate, furrowed. ½ S. Native of Penang. Flowers smaller and more numerous than those of L. reginae, but of the same colour. Perhaps belonging to a different section.

Bundle-flowered Lagerstremia. Tree 20 feet.

Cult. Lagerstremia is a splendid genus of shrubs. L. pudica is a hardy stove plant and easily cultivated, and flowers freely. The rest of the species are more tender, and more difficult to preserve through the winter, at which time they require a great heat and but little water, for if they are too freely watered at this season it is a great chance if they survive. In summer they grow freely, at which time they require plenty of room to grow, and to be plentifully supplied with water. Cuttings of them all root readily if planted in sand, with a hand-glass placed over them in heat.

LIN. SYST. Icosandria, Monogynia. Calyx libracteolate at the base, campanulate, plicately 10-12-toothed at the apex; teeth as if they were joined together by a peculiar membrane. Petals 10-12. Stamens twice the number of the petals. Ovarium 2-celled. Berry coricate, spherical. Placenta central, globose.—American trees. Leaves opposite, quite entire. Peduncles solitary, 1-flowered. Flowers large, white or pale. The bracteas under the flower caducous.

Shewy Lafoensia. Tree 20 to 30 feet.

2 L. acuminata (D. C. l. c.) leaves oblong, bluntly acuminate; fruit spherical, stellately rayed from the middle to the apex. ½ S. Native of Peru, in warm groves about Pozuzo, where it is called by the inhabitants Cabeza de Monge. Calypptéctus acuminatus, Ruiz et Pav. syst. fl. per. p. 129. Racemes large. Fruit sessile, ex Ruiz et Pav. A. acuminate-leaved Lafoensia. Shrub 4 to 6 feet.

3 L. puniceofolia (D. C. mem. soc. hist. nat. gen. 3. pt. 2. p. 86. t. 1.) leaves oblong, bluntly acuminate, with the middle nerve porose at the apex underneath; fruit ovate, globose, smooth, somewhat stipulicated. ½ S. Native of St. Martha. Calypptéctus puniceofolius, Bert. ined. Lafaœnsia Mexicana, Mec. et Sesse, fl. mex. Icon. ined. does not appear to be different.

Pomegranate-leaved Lafoensia. Tree.

4 L. Vandelliæ (D. C. prod. 3. p. 94.) leaves obovate, retuse at the apex, with one gland in the recess, and running down the short petiole at the base, coriaceous, glabrous, shining above; calyx half 10-cleft; fruit ovate-globose, somewhat stipulicated. ½ S. Native of Brazil. Lafaœnsia, Vand. fl. lus. et bras. p. 33. t. 3. f. 13. et Rœm. script. p. 112. t. 7. f. 13. Ovary on a short stipe. Style subulate. Petals oblong, serrated, emarginate at the apex, furnished with a nectariferous scale at the base of each. Vandelliæ Lafoensia. Tree.

Cult. See Lagerstremia for culture and propagation.

† Genera not sufficiently known, and probably not belonging to the present order.

XXVII. PHYSOPODIUM (from φυα, phusa, a bladder, and πος, pous, a foot; in reference to the tumid pedicles). Desv. in ann. sc. nat. 1826. vol. 9. p. 403.

LIN. SYST. Decudndria, Monogyenia. Calyx tubinate, 5-toothed, beset with strigose hairs inside. Petals 5, oval-oblong. Stamens 10, twice the length of the petals, alternate ones a little shorter. Anthers oblong, 2-celled. Ovarium oblong. Style
LYTHRARIEÆ. XXVII. PHYSOPODIUM. XXVIII. SYMMETRIA. TAMARISCINEÆ. I. TAMARIX. 725

capillary, subulate at the apex. Fruit unknown.—Shrub twin-
ing. Leaves alternate, quite entire and glabrous, lanceolate. Flowers in spicate panicles, second, bracteolate; pedicels tumid at the apex. According to De Candolle, this order is allied to Portulaceae from the similitude of the flowers with those of Telephium, but differs in the parietal exalbunimous comose seeds; but according to Auguste St. Hilaire it is more nearly allied to Lythrariae and Onagráriæ, from the former it differs in the estivation of the calyx, as well as in their insertion at the base of the calyx, and in the parietal seeds; from the latter in the free ova-
rium, and in the imbricate estivation of the calyx. Dr. Ehren-
berg, however, asserts that the order has hypogynous stamens. The same botanist in separating the Támarix Songárica of Willd., and referring it to the vicinity of Reumuríia, establishes the affinity of Tamariscineæ to the order Reumuríaceæ.

The bark of all is slightly bitter, and probably tonic. Támarix Gállica and T. Africána are remarkable for the quantity of sulphate of soda which their ashes contain. Dr. Ehrenberg found that the manna of Mount Sinai is produced by a variety of Támarix Gállica. This substance being analyzed by M. Mitscherlich was found to contain no crystalizable matter, but to consist wholly of pure mucilaginous sugar.

Synopsis of the genera.

1 TÁMARIX. Calyx 4-5-parted. Petals 4-5. Stamens 4-5. Stigmas 3, long, glandular and oblique at the apex. Seed inserted at the base of the valves, or almost in the centre of the capsule; hairs on seeds simple.

2 MYRICA'RIA. Calyx 5-parted. Petals 5. Stamens 10. Stigmas 3 in a head. Seeds parietal in the middle of the valves; hairs on seeds feathery.

3 HOLóLA'CHNA. Calyx 4-5-parted. Petals 4-5. Stamens 5-10. Stigmas 2-4. Seeds parietal in the middle of the valves, their whole surface pilose.

I. TAMARIX (so called from growing on the banks of the Tamaris, now Támaris, on the borders of the Pyrenees). Desf. ann. sc. nat. 4. p. 348. D. C. prod. 3. p. 95.—Tamarix, with 4-5 stamens of other authors.

LIN. SYST. Tetra-Decádria, Trigýnía. Calyx 4-5-parted. Petals 4-5. Stamens 4-5, alternating with the petals, almost free. Ovarium tapering to the apex. Stigmas 3, long, divaricate, glandular and oblique at the apex. Seeds erect, inserted nearly at the base of the valves, or almost in the centre of the capsule. Seeds tufted; tuft composed of numerous simple hairs, rising from the apex. Spikes of flowers usually disposed in panicles. Flowers small, red, seldom white.

3. Oligóade'nia (from oligo, oligos, few, and aden, a gland; few surrounding the ovarium). Ehrenberg in Schlecht. Linnaea. 2. p. 253. Globular surrounding the germ, 8-toothed. Filaments 4, one between each alternate tooth of the gland.

Var. ß. octándra (Pall. nov. act. sc. petr. 10. p. 376.) Stamens 8. Capsules 3-4-valved.

Tetrandra'AS TAMARIX. Sch. 6 to 8 feet.

2 T. LÁ'XA (Wildl. act. soc. berol. 1812. vol. 13. p. 82. no. 10.) glabrous, rather glaucous; leaves ovate, sessile, acumi-
dated, erect; racemes lateral, about an inch long; flowers white, short; ovaries shorter than a line in length; bracteas shorter than the pedicels. ß. H. Native of Siberia, in the valleys of Astrakan and Kisliar, about salt lakes. Capsule reddish yellow, hardly a line in length. Calycine segments orbicularly-ovate, acutish, with membranous edges.
TAMARISCINEÆ.  I. TAMARIX.

Loose Tamarisk. Shrub 5 to 6 feet.
3 T. elongata (Lindl. fl. Ross. alt. ill. t. 254. fl. alt. 1. p. 421.) glabrous, glaucous; flowers crowded, pedicellate, disposed in simple, elongated, lateral racemes; bracteoles reflexed, 2 or 3 times longer than the pedicels; calyceal segments broad, ovate, acute, keeled, with membranous margins; petals spreading, exceeding the genitals; styles very short; leaves ovate-lanceolate, acute, when young incurved at the apex; when adult recurved. גו. Native of Siberia, in the desert of Soongaria, in saltish places. Petals reddish.

Elongated Tamarisk. Shrub.
4 T. Parviflora (D. C. pers. 3. p. 97.) glabrous, rather glaucous; leaves small, lanceolate, subulate, a little keeled, acute; spikes lateral, crowded, short; bracteoles longer than the pedicels; ovary not exceeding the corolla when in flower. גו. Native country unknown, but cultivated about Constantinople. Spikes or racemes 9-10 lines long. Flowers white, one-half smaller than those of the first species.

Small-flowered Tamarisk. Shrub.

Sect. II. Decadeëa (from ἐκά, deca, ten, and αἰκόν, adon, a gland; the gland surrounding the ovary is 10-toothed.) Ehrenberg in Schlecht. Linn. 2. p. 253. Gland surrounding the ovary 10-toothed. Petals 5. Stamens 5, one in each of the alternate teeth of the gland.

5 T. Africana (Poir. var. 2. p. 189. Desf. fl. Alt. 1. p. 289.) glabrous, rather glaucous; leaves lanceolate, stem-clasping, imbricate; racemes sessile, scaly, dense, rising from the branches of the same year, usually simple; bracteoles ovate, chaffy; flowers trigynous; capsule 3-valved. גו. Native in the sand along the Mediterranean sea, in Mauritania; shores of Naples, Egypt; and of the Levant at the torrents about Tripol. T. Gallica γ, Wild. spec. 1. p. 1498. The bark is brown, and the flowers a little larger than in T. Gallica.

African Tamarisk. Shrub 6 to 10 feet.
6 T. Tetragyna (Ehrenberg in Schlecht. Linnæa. 2. p. 258.) like the last; but differs in the bracteoles being linear-lanceolate, in the flowers being tetracycous, and in the capsule being 4-valved. גו. Native of the south of Europe. There is a variety of this having the racemes simple at the apex, and proliferous at the base, leafy.

Tetragynous Tamarisk. Shrub 6 to 8 feet.
7 T. Gracilis (Willd. l. c. no. 8.) leaves lanceolate, sessile; racemes short, usually solitary, sessile, rising from the branches of the preceding year; pedicels elongated, about equal in length to the bracteoles. גו. Native of Siberia, in salt marshes at the river Irissch.

Slender Tamarisk. Shrub 4 to 6 feet.
8 T. Effusa (Ehrenberg in Schlecht. Linnæa. 2. p. 258.) leaves lanceolate; racemes loose, elongated, somewhat panicked; pedicels much shorter than the bracteoles. גו. Native of the north of Africa.

Effuse-panicked Tamarisk. Shrub.
9 T. Orientalis (Forsk. descrip. 206.) glabrous, glaucescent; leaves minute, distant, stem-clasping or sheathing, mucronate; spikes or racemes lateral, slender; capsule 4-valved. גו. Native of Arabia, Persia, and the East Indies. Thuya aphylla, Lin. spec. 1422. exclusive of the synonyms. T. articulata, Vahl. symb. 2. p. 48. t. 52. Flowers minute. Bracteoles imbricate. Branches as if they were articulated at the origin of the leaves, with the internodes turbinate. The largest tree of this species appears to be one at Babylon, on the supposed site of the hanging gardens.

Oriental Tamarisk. Tree 10 to 20 feet.

Hispid Tamarisk. Shrub 6 to 8 feet.
11 T. Chinensis (Lour. coch. p. 182.) branches drooping; leaves very minute, imbricate, acute; spikes panicked, slender, and long; petals linear, erect. גו. Native of China, in the province of Canton. According to Lourieiro this plant is nearly allied to T. orientalis. T. Gallica var. Ehr. l. c. Flowers red.

China Tamarisk. Tree 12 to 20 feet.
12 T. dioica (Roth, nov. spec. 185.) glabrous, glaucous; leaves scale-formed, acute, stem-clasping at the base; spikes panicked, very slender, elongated; bracteoles longer than the flowers; stigmas in the female flowers exserted. גו. Native of the East Indies. Stamens none, or 5 inclosed. A female specimen has only been examined.

Diocous Tamarisk. Cl. 1823. Shrub 6 feet.
13 T. Indica (Willd. l. c. no. 5.) glabrous, glaucous; branches stiffish, twiggish; leaves short, ovate, acute, of an obscure green, with white edges; spikes of flowers elongated, straight, panicked; bracteoles shorter than the flowers, subulate, longer than the pedicels; stamens exceeding the corolla. גו. Native of the East Indies. T. apicophylla, Smith in Rees' cyc. 35. no. 4. T. Gallica var. Indica, Ehrenberg, l. c.

Indian Tamarisk. Shrub 6 feet.
14 T. Canariensis (Willd. l. c. no. 4. Buch, can.) glabrous, hardly glaucous; branches divaricate; leaves small, stem-clasping, obscure green, margined with white, ending in long ciliate processes, some adpressed, and some spreading; spikes somewhat panicked, very long, slender; stamens length of the corolla. גו. Native of the Grand Canary Island, along the sea side, and at the entrance of the valleys near Las Palmas. In Tenerife on the east of Santa Cruz, near the sea, where we have seen it growing in great plenty.

Canary Island Tamarisk. Shrub 4 to 6 feet.
15 T. Ramossissima (Lindl. fl. Ross. alt. ill. t. 256. fl. alt. 1. p. 424.) glabrous, glaucous; flowers crowded, disposed in cylindrical racemes, forming a decompound panicle; bracteoles exceeding the pedicels; calyceal segments ovate-ornicular, acutish; petals erectly convolute; styles much shorter than the ovary; leaves ovate-lanceolate, acute, stem-clasping, glabrous. גו. Native of Siberia, at Lake Noir-Loisan. Flowers reddish. T. Gallica, Sievers in Palla. nord. beitr. vii.

Mucb-panicked Tamarisk. Shrub 5 to 6 feet.

Var. a, siáboëlis (Ehrenberg in Schlecht. Linnæa. 2. p. 267.) branches subtile, effuse; leaves glaucous, pale green, a little spreading.

Var. β, Narbonensiæ (Ehrenberg, l. c.) branches stiff, spreading; leaves glaucous, obscure green, densely imbricated, margined with white; spikes of flowers short, rather lateral.

Var. γ, Nilötica (Ehrenberg, l. c. p. 209.) branches effuse, rather loose; leaves short, glaucous, spreading; spikes elongated; gland surrounding the ovary, hypogynous, with 10 equally distant teeth.

Var. δ, arborëæ (Sieb. ex Ehrenberg, l. c.) branches effuse,
thickened, stiffish, nearly terete; leaves glabrous, densely adpressed to the stem; teeth of hypogynous gland usually approximate by pairs.

Var. e, mannifera (Ehrenberg, l. c. p. 270.) branches stiffish; leaves short, glaucous, covered with white powder, spreading; hypogynous gland with teeth at equal distances. The manna of Mount Sinai is the produce of this variety.

a: branches effuse; anthers and gland white. There is another variety of this having the anthers and gland red.

b: branches divaricate; anthers and gland rose-coloured.

Var. f, heterophylla (Ehrenberg, l. c. p. 270.) branches very slender; leaves light green, glabrous, short, acute, the upper ones densely imbricated, the middle ones elongated and bluntish, lower rameal ones broad-ovate, flat; spikes much elongated, all very slender.

French Tamarisk. Fl. May, Oct. Britain. Sh. 6 to 12 ft. 17 T. Pallasi (Desv. ann. sc. nat. 4. p. 294.) glabrous, hardly glaucous; leaves small, acute, imbricated; spikes panicled, rather thickish; stamens twice the length of the corolla; stigmas very short. H. Native at Cape Caucasus, and in deserts about the Caspian Sea. T. pantandra, Pall. fl. ross. t. 77. T. Gallica, Bieb. fl. taur. t. 246. T. paniculata, Steven in litt. A plant gathered by Olivier and Bruguier between Bagdad and Aleppo is very nearly allied to this species.

Pallasi's Tamarisk. Shrub 6 to 12 ft.

18 T. Cupressiformis (Led. fl. ros. alt. ill. t. 253. fl. alt. 1. p. 423.) glabrous, glaucous, flowers remotish, disposed in lateral simple racemes; bracteas shorter than the pedicels; calyxine segments orbicular, with membranous edges; petals spreading; styles much shorter than the ovarium; leaves ovate, stem-clasping, closely imbricated when young. H. Native of Siberia, in the desert of Soongaria, near salt lakes.

Cypress-formed Tamarisk. Shrub 5 to 8 feet.

19 T. Senegalensis (D. C. Prod. 6. p. 96.) glabrous, glaucous; leaves lanceolate-subulate, keeled, somewhat stem-clasping, acute, spreading a little; spikes slender, numerous, panicled; stamens hardly longer than the corolla; ovarium acutely trigonal, almost triangular. H. Native of Senegal, where it flowers in the month of January.

Senegal Tamarisk. Tree.

sect. III. POLYADNE'NA (from poly, many, and a'den, a gland; in reference to the gland surrounding the ovarium being many toothed). Ehrenberg in Schlecht. Linnaea. 2. p. 271. Gland surrounding the ovarium 20-toothed. Stamens 10, one between each alternate tooth of the gland.

20 T. ericoides (Rottl. ex Willd. nov. act. nat. scrut. 4. p. 214. t. 4.) leaves oblone, sheathing; spikes terminal; flowers decandrous; bracteas equal in length to the pedicels. H. Native of the East Indies. Roots creeping deep. T. ericoides, Roth, nov. spec. p. 184. and T. mucronata, Smith in Rees' cyc. do not appear to differ from the present species. Flowers large.

Health-like Tamarisk. Shrub 4 to 6 feet.

21 T. Ampelanes (Ehrenberg in Schlecht. Linnaea. 2. p. 275.) stems shrubby; branches divaricate, intricate; young leaves stem-clasping, glaucous, short, acute, older ones half stem-clasping; flowers small, in spikes; capsule 2 lines long. H. Native of Egypt, in the oases of Jupiter Ammon.

Stem-clasping-leaved Tamarisk. Shrub 4 to 6 feet.

22 T. Pyco'cara (D. C. Prod. 3. p. 97.) leaves stem-clasping, ovate, acute, small, when young adpressed, at length spreading and mucronate; spikes panicled; flowers decandrous; bracteas equal in length to the pedicels; fruit ovate, trigonous, turgid. H. Native of the Levant, along the road side between Bagdad and Kermanka.

Slender-fruited Tamarisk. Shrub 2 to 3 feet.

23 T. Passerinoides (Del. fl. ægypt. p. 58. Desv. in ann. sc. nat. 4. p. 349.) stem erect; branches cuneiform, diffuse; leaves half stem-clasping all the summer, short, somewhat triangular, canescent; capsule 8 lines long. H. Native of Arabia and Egypt, in arid places.

Var. a, divaricata (Ehrenberg in Schlecht. Linnaea. 2. p. 275.) branchlets divaricate; leaves densely imbricated, obtuse, adpressed; flowers large; capsule about 4 lines long. H. In the oases of Jupiter Ammon.

Var. b, Hammonis (Ehrenberg, l. c.) branches straight, toreose; leaves hoary, densely imbricated, bluntish, adpressed; flowers small; capsule 3 lines long. H. In the oases of Jupiter Ammon.

Var. c, macrocarpa (Ehrenberg, l. c.) branches loose, erectish; leaves short, dilated, acuminate, glaucous, rather remote, at length spreading; flowers large; capsule about half an inch long.

Pascrinia-like Tamarisk. Shrub.

Cult. Tamarix is a genus of very pretty and delicate shrubs. The hardy species are fit ornaments for decorating shrubberies; they will grow well in dry or situation, and cuttings planted out in the open ground in autumn or early in spring strike root readily. The stote and greenhouse kinds succeed very in a mixture of loam and peat; and cuttings of them root freely in sand under a hand-glass, those of the former in heat.

II. MYRICARIA (myrus, myric, in Greek, a synonyme of Tamarix, derived from myrus, myro, to run; from growing on the banks of running streams). Desv. ann. sc. nat. 4. p. 349. D. C. Prod. 3. p. 97. Ehrenberg, in Schlecht. Linnaea. 2. p. 275.—Tamarix species of authors. Lin. syst. Monadelphia, Decândria. Calyx 5 parted. Petals 5. Stamens 10, alternate ones shorter than the rest; filaments monadelphous from the base to about the middle. Stigmas 3, sessile, in a head. Seeds inserted in a line along the middle of the valves, ascending, tufted at one end; hairs of tuft feathery. Flowers in simple, solitary, terminal spikes.

§ 1. Leaves long, linear, or oblong, sessile, becoming gradually broader towards the base.

* Shrubby; fruit pedicellate.

1 M. Germa'nica (Desv. l. c. p. 340.) shrubby; leaves linear-lanceolate, flat; racemes subsipicate, elongated, terminal, solitary, but those at the tops of the branchlets are branched; mature flowers distended, ascending; bracteas longer than the pedicels; capsules ascending. H. Native nearly throughout the whole of Europe, on the banks of rivers; and of Caucasus. Mill. fig. t. 262. f. 2. Tamarix Germánica. Lin. spec. p. 366. Soehkhrs, handb. t. 35. fl. dan. 343. Blackw. t. 331. Tamariscus decândrus, Linn. fl. fr. T. decândra, Moench. Tamariscus decândrus, Lob. Icon. 2. t. 218. Flowers pink. Tamarisk, especially this species, is sometimes used abroad in obstructions of the lower viscers, and especially in diseases of the spine. By combustion it yields a considerable quantity of fixed salt, which is diuretic and aperient, and approaches to Glauber's salts. The bark of the root is the most efficacious part. A decoction of this is given in doses of 2 or 3 drachms, or even an ounce; of the wood and leaves double that quantity may be taken.

German Myricaria. Fl. June, Sept. Cilt. 1582. Sh. 6 to 8 ft.

2 M. Dah'ru'ica (D. C. Prod. 3. p. 98. Ehrenberg, l. c.) shrubby, glabrous; leaves linear-lanceolate, flat; racemes subsipicate, obtuse, lateral, but those on the secondary branches are terminal and simple; bracteas equal in length to the flowers; mature flowers coardate, ascending. H. Native of Siberia,
TAMARISCINEÆ. II. MYRICARIA. III. HOLOLACHNA. MELASTOMACEÆ.

beyond the Baikal, and of Daharia. Tamarix Dahurica, Willd. l. c. no. 16. Flowers pink.

Dahurian Myricaria. Cl. 1818. Shrub 4 to 8 feet.

3 M. squamosa (Desv. l. c. p. 350.) shrubby; glabrous; leaves oblong, keeled; racemes lateral, short, scaly at the base. l. H. Native of Siberia. Flowers pink?

Scaly-racemed Myricaria. Shrub 4 to 6 feet.

* * Herbaceous; fruit obsolete or pedicellate.

4 M. herbaecea (Desv. l. c. p. 350.) glabrous; leaves linear-lanceolate; spikes terminal, simple, solitary; bracteas longer than the flowers; capsules spreading. 2. F. Native about the Caspian Sea, on the Persian side. Tamarix Germánica subherbaecea, Pall. fl.ross. 2. p. 73. t. 80. f. 3. T. Germánica, Willd. l. c. no. 14. T. Germánica Cásptica, Pers. Flowers red.

Herbaceous Myricaria. Pl. 3 to 4 feet.

§ 2. Leaves flat, lanceolate-linear, sessile, constricted near the base.

5 M. longifolia (D. C. prod. 3. p. 97. Ehrenberg, l. c. p. 279.) leaves spreading; racemes terminal, compound at the base; pedicels elongated, about equal in length to the expanded flower; bracteas with membranous edges; capsules nodding. 2. H. Native of Siberia, at the Baikal, in saltish places. Tamarix Germánica, Pall. fl. ross. 2. p. 73. T. decáundra, Pall. l. c. t. 80. f. A. Tamarix longifolia, Willd. l. c. no. 15. M. linearífolia, Desv. l. c. p. 349. Flowers red.

Var. a. laxíflora (Ehrenberg, in Schlecht. Linneoa. 2. p. 279.) flowers distended; capsules drooping.

Var. b. coarctátia (Ehrenberg, l. c.) flowers coarctate; capsules drooping.

Long-leaved Myricaria. Shrub 4 to 6 feet.

Cul. For culture and propagation, see hardy species of Tamarix, p. 727.

III. HOLOLACHNA (from ὅλος, holos, the whole, and λαχνή, lachne, wool; in reference to the whole surface of the seeds being covered with hairs). Ehrenberg, in Schlecht. 2. p. 273. Tamarix species of Pall.

Linn. subf. Monadelphí, Decáündria. Calyx 4-5 parted. Petals 4-6. Stamens 8-10, hypogynous, monadelphous, inserted in the hypogynous gland. Styles short, subulate, 2-4. Capsule 2-4 angled, 2-4-valved, 2-4 celled. Seeds few, large, with the whole surface plicate, attached to the dissepiments in the middle of the valves.—A small shrub, with trigonal, fleshy, obtuse, spreading leaves; spikes lateral; flowers nearly sessile, about equal in length to the bracteas.

Soongarián Hololachna. Shrub 2 to 3 feet.

Cul. See hardy species of Tamarix for culture and propagation. The plant requires to be refreshed with salted water at the roots now and then.

Calyx divided into 4, 5 (f. 808. b.), or 6 lobes (f. 109. b.), cohering more or less with the angles of the ovary, but distinct from the surface between the angles, and thus forming a number of cavities, within which the anthers are curved downwards. Petals equal in number to the segments of the calyx (f. 108. d. f. 111. c. f. 113. b.), arising from their base, or from the edge of the disk that lines the calyx, twisted in aestivation (f. 112. b.). Stamens usually twice as many (f. 109. d. f. 110. c.), sometimes equal to them in number; in the former case those which are opposite to the segments of the calyx are alone fertile; filaments curved downwards in aestivation; anthers long (f. 109. c. f. 111. e. f.), 2-celled, usually bursting by 2 pores at the apex (f. 111. c.), which is rostrate, and elongated in various ways (f. 109. c.) beyond the insertion of the filaments; sometimes bursting longitudinally (f. 113. c.) before flowering contained within the cases between the ovary and sides of the calyx. Ovary more or less coherent with the calyx (f. 113. e. d.), with several cells, and indefinite ovulas; style 1 (f. 109. d. f. 113. f.) stigma simple, either capitate or minute; a cup often present upon the apex of the ovary, surrounding the style. Pericarpium either dry and distinct from the calyx, or succulent and combined with the calyx, with several cells; if dehiscent bursting through the valves, which therefore bear the septa in the middle; placentas attached to a central column. Seeds innumerable, minute, with a brittle testa, and no alburnum, usually with appendages of some kind; embryo straight or curved, with equal or unequal clypeolons.—Trees, shrubs, or herbaceous plants. Leaves opposite, undivided, usually entire, without dots, with several ribs. Flowers terminal, usually thyrsoid.—De Candolle's remarks, in his memoir upon Melastomáceae, although composed of exotic plants, and established at a period when but few species were known, is so well characterised, that no one has ever thought of putting any part of it in any other group, or even introducing genera into it that do not rightly belong to it. These distinct characters are the opposite leaves, with several great veins or ribs running from the base to the apex, something as in monocotyledonous plants, and in long beaked anthers, to which, combined, there is nothing to be compared in other families. The greatest affinity is upon the one hand with Lythrariaceæ, on the other with Myrtácææ; from the former it differs in the aestivation of the calyx not being valvate, from the latter in having the petals twisted before expansion, and no dots on the leaves, and from both, and from all others to which they can be compared, in their long anthers bent down parallel to the filaments in the flower, and lying in niches between the calyx and ovary; with the exception of Memécylææ, in which, however, the union between the calyx and ovary is complete. The structure of the seeds of Memécylææ is also different.—A slight degree of astringency is the prevailing character of the order, which is, although one of the most extensive known, entirely destitute of any unwholesome species. The succulent fruit of many is eatable, some of which dye the mouth black. "Blékke trinéris produces a yellow fruit, which is pleasant and eatable, in the woods of Guiana." (Hamil. prod. p. 42.)

Synopsis of the genera.

Sub-order I. Melastómæa. Anthers opening by 1-2 pores.

 Tribe I.

Lavoisierææ. Ovarium free, neither secal nor bristly at the
apex. Capsule dry. Seeds ovate or angular, with a lateral linear hilum.

1 Merania. Calyx campanulate (f. 108. a.), 5-6-lobed; lobes subulate at the apex (f. 108. b.). Petals 5-6 (f. 108. d.). Anthers opening by 2 pores, furnished with a short spur at the base. Capsule 5-celled; placenta lunate.

4 Lavoisierea. Calyx turbinate, 5-10-lobed. Petals 5-10. Stamens 10-20. Anthers opening by 1 pore, furnished with a short, blunt beak; the alternate ones drawn out into a 2-lobed appendage at the base. Capsule 5-10-celled.

5 Davya. Calyx campanulate, with the teeth concrete into an entire, membranous limb. Petals 5-6. Anthers beaked, opening by 1 pore: having the connectives drawn out at the base in a simple or bristled spur. Capsule 5-celled.

7 Centronia. Calyx oblong, beset with bristles; with a coriaceous, entire limb. Petals 5. Anthers with a long beak, and furnished with a long subulate process at the base. Capsule 5-celled.

8 Truncaeria. Calyx cylindrical; limb truncate, almost entire. Stamens 10. Anthers elongated, beaked, but without any process at the base, opening by 1 pore.

9 Rhynchchanteria. Tube of calyx ovate, globose; lobes 5, linear or setaceous. Petals 5. Stamens 10, 5 of which are sterile. Anthers ending in a long beak, with the connectives long and auricled at the base. Capsule 3, but usually 5-celled.

10 Macarea. Tube of calyx ovate; lobes 4. Petals 4. Stamens 8, the 4 longest beset with glandular hairs inside. Anthers linear, opening by 1 pore: in 4 of which the connective is elongated and stipe-formed. Capsule 4-celled.

12 Cameresaeria. Tube of calyx globose; lobes 5, narrow. Petals 5. Stamens 10. Anthers linear, falcate; a little beaked, drawn out at the base into an obtuse, undivided auricle, each of various lengths. Capsule 3-celled.

13 Chetostoma. Tube of calyx obovate-turbinate, girded by a ring of 4-5 stiff bristles under the lobes, which are 4-5. Petals 4-5. Anthers with short beaks, with the connectives hardly drawn out at the base. Capsule prismatic, 4-5-gonal.

15 Bertolonia. Calyx campanulate, 5-lobed; lobes some-
times nearly obsolete. Petals 5. Anthers ovate-obtuse, opening by 1 pore: attenuated at the base, but hardly or not auriculated. Capsule trigonal, 3-valved.

16 Melissa. Calyx globose, 4-lobed. Petals 4. Stamens 8. Anthers ovate, beaked, tubular; in 4 of which the connec-
tive is long and auricled at the articulation, in the other 4 it is hardly evident. Capsule 2-celled.

TRIBE II.

Rhexia. Anthers opening by 1 pore at the apex. Ovar-
ium free, neither seedy nor bristly at the apex. Capsule dry. Seeds cohericate, with an orbicular basilar hilum. Species all American, except one.

17 Appendicularia. Tube of calyx somewhat urceolate; limb somewhat campanulate, bluntly 4-toothed. Petals 4. Stamens 8, equal. Connectives drawn out into 2 long bristles at the articulation beneath and above the cells of the anthers. Capsule 3-celled, 3-valved.

18 Cosolia. Tube of calyx campanulately cylindrical; lobes 4-linear. Petals 4. Anthers 8, oblong-linear, falcate; having their connectives short and drawn out into 2 auricles at the articulation. Capsule ovate, 2-celled.

19 Spyneria. Calyx globose, with 4-5 short lobes. Pet-
als 4-5. Stamens 8-10. Anthers ovate, obtuse, with their connectives long, but not appendiculately. Capsule 2, rarely 3-celled.

20 Microlia. Calyx globose, or obovate; lobes 5, sula-
bulate. Petals 5. Anthers alternately dissimilar, ovate, short-beaked, with their connectives drawn out into a simple spur at the articulation. Capsule 3-celled, 3-valved.

23 Rhexia. Tube of calyx ventricose (f. 109. a.) at the base, but narrowed into a neck at the apex (f. 109. b.), limb 4-cleft. Petals 4. Anthers 8 (f. 109. c.), with their connectives hardly evident and not auriculated. Capsule at the bottom of the calyx, 4-celled; placenta lunate, pedicellate.

24 Heterosoma. Calyx tubular, 4-toothed. Petals 4. Anthers 8, alternate ones longer; the connectives of the shorter ones drawn out into 2 bristles, of the longer ones into a linear appendage, each of which is bifid at the apex. Capsule 4-celled.

25 Pachylobia. Calyx obconically cylindrical, drawn out beyond the ovary, hardly 4-toothed. Petals 4. Stamens 8, equal. Anthers linear, elongated: with the connectives long in 4 of them, and drawn out into a simple bristle-like appendage at the base, but in the other 4 drawn out into 2 bristle-like appendages each.

26 Oxyshora. Calyx oblong, 4-lobed. Petals 4. Sta-
mens 8, equal. Anthers elongated, drawn out into 2 blunt spurs at the base, with their connectives hardly perspicuous. Capsule 4-celled, 4-valved.

27 Taneinterum. Calyx ovate; lobes 4, narrow, often with 5 A
3 bristles at the apex. Anthers 8, linear: having their connectives furnished with 3 spurs at the base. Capsule 4-celled.

28 MARCETIA. Calyx oblong or cylindrical, 4-lobed. Petals 4. Stamens 8, equal. Anthers oblong, with 2 tubercles at the base. Capsule 4-valved, 4-celled.

29 TREMELIÆA. Calyx ovate, constricted at the apex, 5-lobed. Petals 5. Stamens 10, with 5 of the anthers ovate, shortly and bluntly beaked, having their connectives drawn out into an obcordate or spatulate simple ligula: the 5 alternate ones having the ligula almost abortive. Capsule 5-celled.

TRIBE III.

ORBE'CKIE. Anthers opening by one pore at the apex. Ovary sometimes free, sometimes adnate to the calyx, crowned by bristles or scales at the apex. Seeds coelolate; with an orbicular, basilar hyllum.—Species American, African, Asiatic, and a few Australian.

31 LASIA'NDRA. Calyx ovate; lobes 5, narrow. Petals 5. Stamens 10, pilose. Anthers elongated, with a short beak: having their connectives tumid and biauriculate at the base. Ovary pubescent at the apex, rather adnate to the calyx. Capsule 5-celled.

32 CLÉTOCA'STRA. Calyx turbinate (f. 109. a.), pilose or scaly, 5-lobed. Petals 5 (f. 109. d.). Filaments 10, glabrous. Anthers oblong: having their connectives drawn out into a simple or bifid spur, and sometimes only into 2 blunt tubercles. Ovary hairy at the apex. Capsule 5-celled.

33 ARTHROSTE'MMA. Calyx turbinate or campanulate, usually beset with bristles or scales on the outside, 4-lobed. Petals 4. Stamens 8, glabrous. Anthers oblong: having their connectives rather long, and bluntly biauriculate at the base. Ovary hairy at the apex. Capsule 4-celled.

34 ORBE'CKIA. Calyx ovate, usually clothed with stellate bristles or down on the outside, 4-5-lobed, furnished with appendages between the lobes on the outside, of various forms and sizes. Petals 4-5. Stamens 8-10, glabrous. Anthers nearly equal, ending in short beaks, but their connectives are furnished with 2 short auricles at the base. Ovary hairy at the apex. Capsule 4-5-celled.

35 THOU'CHINA. Calyx turbinate, clothed with imbricate scales on the outside: and girded by a double involucrem at the base, both composed of 2 conuate bracteae; lobes 5. Petals 5. Stamens 10, glabrous. Anthers with their connectives bluntly biauriculate at the base. Ovary free, bluntly at the apex.

36 TRISTÉ'MMA. Calyx tubular, girded by many bracteae at the base, 4-5-cleft, and furnished with bearded appendages near the limb. Petals 4-5. Stamens 8-10. Anthers arched, biauriculate at the base. Ovary hardy adnate to the calyx at the base, bluntly at the apex. Berry 4-5-celled.

37 SÁRCPY'RAMES. Calyx obversely pyramidal, adnate to the ovariurn at the base, with a truncate 4-toothed limb; teeth ciliated. Petals 4. Stamens 8. Anthers simple, straight, naked, opening by 2 pores at the apex. Capsule square, 4-winged at the apex, 4-celled, 4-valved. Seeds triangular.

38 MELA'STOMA. Calyx ovate, densely covered with scales or bristles; limb 5, (f. 111. a.) nearly 6-cleft, the segments alternating with deciduous appendages. Petals 5-6. Stamens 10-12. Anthers a little arched: the connectives stipe-formed (f. 111. e.) in the longer anthers, in the shorter ones biauriculate (f. 111. f.) or emarginate. Ovarium biauriculate at the apex. Capsule baccate, 6-5-celled.

39 OTANTHE'RA. Calyx with an ovate tube, half adhering to the ovariurn, beset with palmately ciliate scales; limb 5-cleft, deciduous. Petals 5. Stamens 10, equal. Anthers oblong-linear, a little arched, tapering upwards, and opening by a pore, but biauriculate in front at the base. Ovary hairy at the apex. Berry 5-celled, pulpy.

40 LACHNORÓDÆUM. Tube of calyx ovate-oblong; limb 5-cleft; segments subulate. Petals 5. Stamens 10, equal; filaments girded by a ring of hairs at the base; anthers oblong, beaked, naked. Capsule 5-celled; crowned by the segments of the calyx.

41 PLÉBÔMA. Calyx ovate, when young often inclosed in 2 bracteae; lobes 5, deciduous. Petals 5. Stamens 10, glabrous. Anthers nearly equal, elongated, arched at the base: having their connectives stipe-formed, and furnished with 2 short auricles at the base. Ovary adnate to the calyx, biauriculate at the apex. Capsule baccate, 5-celled.

42 DIPLOSTE'GÆUM. Calyx 5-cleft, inclosed in the double, cucullate, hispid calyxtro. Petals 5. Anthers nearly equal, biauriculate at the base. Capsule baccate, 5-celled.

43 ACIOTS. Calyx glabrous, fleshy; limb coarctate, 4-toothed. Petals 4, awned. Stamens 8, furnished with long connectives, and as if it were jointed in the middle. Anthers erect, naked at the base. Capsule baccate, 4-celled.

44 CENTRADÆNIA. Calyx somewhat campanulate, tetragonal; limb 4-toothed. Petals 4. Stamens 8, unequal; the connectives of the larger anthers are drawn out into an elongated cuneate spur, but those of the smaller anthers are gland-formed. Capsule 4-valved, 4-celled.

Tribe IV.

MICÓNIE. Anthers opening by 1 or 2 pores at the apex. Ovarium adnate to the calyx. Fruit baccate. Seeds not coelolate. Species for the most part American.

45 ROUSSEAU'XIA. Calyx hemispherical, glabrous, 4-lobed. Petals 4. Stamens 8. Anthers oblong-linear, sometimes all fertile, with their connectives somewhat gibbous at the base: sometimes the alternate ones are sterile, with short connectives, the rest fertile with long connectives, which are furnished with 2 bristles at the base. Ovary furnished with 4 scale-like bristles at the apex.

46 LEA'NDRÆA. Calyx urceolate, drawn out beyond the ovariurn; lobes double, 4-6 exterior ones subulate, 6 interior oval. Petals 4-6. Stamens 8-12. Anthers linear, hardly biauriculate at the base. Berry dry? 3-4-celled.

47 TSCHU'DY. Calyx glabrous; lobes 5, bristle-formed. Stamens 10. Anthers oblong, without auricles. Ovary free, bluntly at the apex. Capsule globose, 4-5-celled.

51 Male'ta. Calyx oblong-ovate, more or less hispid, and often bracteate; lobes 5, subulate. Petals 5. Stamens 10. Anthers equal: having short connectives, which are biauriculate behind. Ovarium glabrous. Berry 5-celled.

53 Soner'la. Calyx with an oblong or somewhat trigonal tube, usually muralicate, adhering to the ovarium; limb trifid, deciduous. Petals 3. Stamens 3; anthers linear-oblong, emarginate at the base, opening by 2 pores at the apex. Ovarium glabrous at the apex. Capsule turbinate, 3-celled.

55 Pachy'cynthia. Tube of calyx cup-shaped, constricted beneath the middle; limb obsolete 4-toothed. Petals 4. Stamens 8, equal. Anthers oblong-linear, beaked at the apex, and furnished with a thick, fleshy connective at each. Free part of ovarium angular. Berry globose, 4-celled.

56 Pogonanth'ra. Tube of calyx cup-shaped, rather quadrangular, adhering to the ovarium at the base; limb 4-cleft. Petals 4. Stamens 8; anthers oblong, acute, bearded at the base. Ovary hairy at the apex. Berry globose, 4-celled, pulpy.

59 Octicho'charis. Tube of calyx obovate, adhering to the ovarium; limb obscurely 5-toothed, permanent. Petals 5. Stamens 10, equal; anthers oblong, straight, ending each in a bristle at the base. Ovarium truncate and glabrous at the apex. Capsule globose, umbilicate, dry, 3-celled, opening irregularly.

60 Calyxo'ochnium. Tube of calyx nearly globose, 4-5-sided; limb 4-5-lobed, longer than the tube. Petals 4-5. Stamens 8-10, equal. Anthers oblong, without any auricles at the base. Berry roundish, 4-5-angled, 4-5-celled.

63 Tetrazy'gia. Tube of calyx globose or urceolate; limb drawn out beyond the ovarium, 4-toothed. Petals 4. Stamens 4-8, equal. Anthers linear, obtuse at the base. Ovarium glabrous. Berry 4-celled.

64 Dissoc'he'ta. Calyx with an oblong, obscurely tetragonal tube, adhering to the ovarium; with the limb drawn out beyond the ovarium, permanent, and 4-toothed at the apex. Petals 4. Stamens 4, sometimes 8, but the alternate ones are usually sterile. Anthers oblong, linear, furnished on the back near the base with a lamellate, 2-awned, rarely undivided connective. Berry globose, nearly dry, somewhat 4-celled, indehiscent.

65 Aple'ctrum. Calyx with an ovate, globose tube: having the limb drawn out beyond the ovarium, which is truncate or obsolete 4-toothed. Petals 4. Stamens 8, alternate ones sterile. Anthers oval, thick, blunt at both ends. Ovarium crowned by 4 crests. Berry subglobose, 4-celled?

67 Cosost'cia. Limb of calyx conical (f. 111. a. b.), calyptriform (f. 111. a.), undivided, at length circumcised or irregularly ruptured at the base, and falling off in one piece (f. 111. a.). Petals 5-6. Stamens 10-16. Anthers usually biauriculate at the base. Berry 3-8-celled.

68 Diplo'nea. Calyx with a calyptriform, conical, deciduous limb. Petals 4, inserted in the fleshy disk. Stamens 8. Anthers ovate, bicalcarate at the base. Ovarium adhering to the calyx, crowned by the large fleshy disk.

69 Diplo'chita. Calyx adhering only at the base to the ovarium, conical, inclosed in 2 bracteas when young: having the throat usually ciliated after flowering; limb 5-6-toothed, drawn out beyond the ovarium. Petals 5-6. Anthers biauriculate at the base. Capsule dry, 5-celled.

72 Maru'mia. Tube of calyx adhering to the ovarium at the base, oblong-ovate, bristly; limb quadrifid, drawn out beyond the ovarium, with the segments permanent. Petals 4. Stamens 8; anthers linear, arched, beaked at the apex, and opening by 1 pore, furnished with a fascicle of bristles at the base. Ovarium villous at the apex. Berry ovate, 4-celled.
73 CRECHTON. Tube of calyx globose, adhering to the ovarium; limb short, obtusely 4-toothed, permanent. Petals 4. Stamens 8, equal. Anthers long, thick, arched, beaked, apiculate at the base by a short connective each. Ovary glabrous. Berry dry, globose, 4-celled.

74 PHYLLOLACTIS. Tube of calyx oblong, glabrous, adhering to the ovarium at the base; limb 4-cleft, drawn out beyond the ovarium. Petals 4. Stamens 8, equal. Anthers arched, beaked at the apex, but unappendiculate at the base.

75 LOE'YA. Calyx campanulate, truncate at the apex, only adhering to the ovarium at the very base. Petals 5. Stamens 10. Anthers thick, ovate, obtuse, somewhat gibbous at the base. Berry 5-celled.

77 OXY'MERIS. Calyx obovate-turbinate; teeth 5, callous, very short. Petals 5. Stamens 10, equal. Anthers oval-oblong, obtuse, tapering to the base: having their connectives filiform, short, and rather gibbous at the base. Berry 3-5-celled.

78 CREMA'NIUM. Tube of calyx campanulate or obovate; limb 4-5-toothed. Petals 4-5. Stamens 10, equal. Anthers short, rather connate at the base, opening by 2 pores at the apex. Berry 3-5-celled.

79 BLA'KEA. Calyx campanulate, girded at the base by 4-5 broad scales, which are disposed crassly or in a triple order; limb membranous, 6-lobed, or 6-toothed. Petals 6. Anthers large, twisted into a ring, obtuse at the apex, and opening by 2 pores, and furnished with a short spur-like process at the base. Berry crowned by the calyx, 6-celled.

Sub-order II. CHARIA'STHE. Anthers 2-celled, bursting longitudinally by 2 slits (f. 113. c.). Fruit fleshy. Seeds cuneate, angular.

81 E wy'CKIA. Tube of calyx hemispherical, adhering to the ovarium; limb truncate, obtusely 4-toothed. Petals 4. Stamens 8, equal. Anthers oblong, obtuse at both ends, furnished each at the base with a short fleshy connective. Berry globose, 4-celled.

82 CHARIA'SThUS. Tube of calyx ovate, rather urceolate; (f. 113. a.) limb 4-toothed. Petals 4. (f. 113. b.) Stamens 8. Ovary adnate to the calyx (f. 113. c.). Berry globose, umbilicate, 4-celled.

83 CHENOLEU'RA. Calyx adnate to the ovary; limb bluntly 5-toothed. Petals 5. Stamens 10. Anthers bluntly biariculate at the base. Berry 3-4-celled.

84 ASTRONIA. Calyx adnate to the ovary; limb 5-6-toothed. Petals 5-6. Stamens 10-12; filaments compressed. Berry dry, umbilicate, 2-4-celled.

Sub-order I. MELASTOME. (plants agreeing with Melastoma, in the anthers opening by pores at the apex). Ser. in D. C. prod. 3. p. 100. Anthers bursting by 1 or 2 pores at the apex.

Tribe 1.

LAVOISIEREE (plants agreeing with the genus Lavoisiera in the characters mentioned below). D. C. prod. 3. p. 100. Anthers bursting by 1 or 2 pores at the apex. Ovary free from the calyx, neither scaly nor bristly at the apex. Capsule dry. Seeds ovate or angular, never coelolate, with a lateral linear hilum.—American plants.

Lin. syst. Decandria, Monogynia. Calyx with a campulate tube, and a 5-6-lobed limb (f. 108. b.); lobes broad, dilated, and membranous at the base and subulate at the apex. Petals 5-6. (f. 108. d.) Stamens 10-12. Anthers obtuse at the apex, and bursting by 2 pores, furnished with 2 short processes at the base. Ovary glabrous, rather depressed, glabrous at the apex. Style filiformly-clavate. Capsule free, 5-6-celled; placenata lunate. Seeds small, cuneately angular.—Trees or shrubs, native of Jamaica or South America. Leaves petiolate, denticulate, glabrous, or hardly downy on the nerves. Flowers large, petiolate, solitary, axillary, white, or purple.

1 M. LEUC'ANTHA (Swartz, fl. ind. occ. p. 826.) branches tetragonally compressed, glabrous; leaves petiolate, ovate-oblong, acuminate, 3-nerved, denticulated, glabrous; peduncles axillary, solitary; bracteas 2, under each flower, ovate-lanceolate, 3-nerved, quite entire; tube of calyx campanulate, 5-lobed; lobes broad at the base and subulate at the apex. S. Native of the higher mountains of Jamaica. Rhéxia leucantha, Swartz, prod. 61. Rhéxia speciosa, Bert. in herb. Balb. Petals white, reddish at the base. Anthers large, appendiculate by a short horn.

2 M. RÔSEA (Tuss. fl. ant. p. 78. t. 1.) branches terete, glabrous; leaves petiolate, oval, 3-nerved, rather serrulate, glabrous; pedicels axillary, 1-flowered, longer than the pedi-cels; bracteas 2, linear, rather dilated at the apex. S. Native of Jamaica. Flowers rose-coloured, drying black. This species differs from M. purpurea in there being only 2 bracteas under each flower, not 4; from M. leuca'ntha in the colour of the flowers, and from both in the form of the bracteas.

Rose-coloured-flowered Jamaica Rose. Shrub 6 feet.

3 M. PUR'PUREA (Swartz, fl. ind. occ. p. 826.) branches terete, glabrous; leaves petiolate, ovate-lanceolate, denticulated, glabrous; peduncles axillary, opposite, longer than the pedicels; bracteas 4, under each flower, lanceolate, denticulated; tube of calyx campanulate, 5-lobed; lobes broad at the base and subulate at the apex. S. Native of Jamaica, on the tops of the mountains. Rhéxia purpurea, Swartz, prod. p. 61. Flowers purple or blood-coloured. Leaves brownish-green. Purple Jamaica Rose. Clt. 1825. Shrub 6-10 feet.

4 M. OR'TUSIFO'LLA (D. C. prod. 3. p. 101.) quite glabrous; branches nearly terete; leaves on short petioles, elliptic, obtuse, somewhat emarginate, coriaceous, 3-nerved, besides 2 small, marginal nerves, denticulate; pedicels axillary, 1-flowered; bracteas ovobovate, 3-nerved, denticulate, 4 under each flower. S. Native of S. Domingo. Melastoma involucrata, Desv. in Lam.
MELASTOMACEÆ. I. Meriania. II. Axinæa. III. Chastenæa. IV. Lavisiæa.

LIN. SYST. Deca-Dioecæiæ, Monogyniæ. Calyx cup-shaped, naked at the base; limb permanent, 5-6-toothed. Petals 5-6. Stamens 10-12. Anthers obtuse at the apex and opening by 2 pores, and ending in a simple spur at the base. Capsule, 5-6-celled.—Fluorescens or shrubs, natives of Peru. Leaves ovate-lanceolate, or broadly cordate, coriaceous, dentate, or crenated, 5-nerved, reticulately veined, petiolate, wrinkled or flat above, clothed with short brown tomentum beneath. Flowers terminal, corymbosus, or sub-racemose, large, purple, or white.

1 A. PURPURÆA (Ruiz et Pav. syst. 1. p. 122.) leaves cordate, 7-nerved, crenated, reticulately veined, wrinkled above and scabrous, but lanose and clothed with brown tomentum beneath; peduncles 1-flowered, corymbosus. h. s. Native of Peru, in groves. Ruiz et Pav. fl. per. 5. t. 510. Flowers purple.

Purple-flowered Axinæa. Shrub 6 to 10 feet.

2 A. MURICATA (D. Don, in wern. soc. mem. 4. p. 321.) leaves large, elliptic, crenated, 5-nerved, shortly acuminated, rather cordate at the base, naked above, but granular beneath as well as the branches; calyxes muricate. h. s. Native of Peru. Leaves a foot long and 5 inches broad. Panicle terminal, many-flowered.

Muricate-calyx Axinæa. Shrub 5 to 8 feet.

3 A. LANCEOLATA (Ruiz et Pav. l. c. p. 122.) leaves elliptic, acuminate, toothed, 5-nerved, flat above, clothed with fuscous tomentum beneath; racemes panicked and terminal. h. s. Native of Peru, in woods at Muná and Pimao. Ruiz et Pav. fl. per. 5. t. 509.

Lanceolate-leaved Axinæa. Shrub 6 to 10 feet.

4 A. GLANDULOSA (Ruiz et Pav. fl. per. 5. t. 512.) leaves ovate, 5-nerved, dentilicate, clothed with yellowish tomentum beneath, but flat and glabrous above and biglandular at the base; panicle terminal, many-flowered. h. s. Native of Peru. Tree frondose. Flowers white.

Glandular Axinæa. Shrub 6 to 10 feet.

5 A. DEPENDENS (Ruiz et Pav. fl. per. 5. t. 511.) leaves lanceolate, acuminated, dentilicate serrated, 5-nerved, glabrous above; raceme terminal, panicled, pendulous. h. s. Native of Peru

Hanging-racemed Axinæa. Shrub 6 to 10 feet.

Cult. This genus is composed of elegant flowering shrubs like the last; and its species are cultivated and propagated in the same manner.

III. CHASTENÆA (in honour of Victorina de Chasteny, who drew and painted the plants collected by Madame Merian in an elegant style. See Meriania and Caléndrier de flore, &c.). D. C. prod. 3. p. 102.

LIN. SYST. Deca-Áecæiæ, Monogyniæ. Calyx naked at the base, campanulate, truncate, entire. Petals 5, obovate. Stamens 10; filaments flat; anthers linear, acute, bursting by 1 pore, having the connectives dilated into a large, rounded, and perhaps hollow appendage. Style filiform; stigma a pruinose dot. Ovary free, glabrous. Capsule 5-celled, opening at the apex. Seeds unknown.—A smooth shrub, with the habit of Meriania. Leaves petiolate, oval, 3-nerved, entire, coriaceous. Flowers pedicellate, ample, bractless, disposed somewhat in umbels at the tops of the branches and branchlets.

1 C. MÉRIA'NLÉ (D. C. l. c). h. s. Native of South America, but in what place is unknown. Flowers purple, according to the dried specimen.

Merian's Chastenæa. Shrub 4 to 6 feet.

Cult. See Meriania for culture and propagation. An elegant shrub, worthy of cultivation.

IV. LAVOSIIÆA (this genus is dedicated by de Candolle to the celebrated but unfortunate Lavoir, whose name deserves this mark of respect). D. C. prod. 3. p. 102.

LIN. SYST. Deca-Áecæiæ, Monogyniæ. Tube of calyx turbinate-oblong; lobes 5-10. Petals 5-10, oval, or obovate. Stamens 10-20. Anthers ovate, terminating in a short blunt beak at the apex, and bursting by a single pore, dissimilar from the connectives being alternately long and drawn out into a long, somewhat 2-lobed appendage at the articulation, and the others being short and hardly produced. Ovary not bent with bristles at the apex. Capsule 5-10-celled. Seeds angular.—Brazilian shrubs, nearly all glabrous. Leaves sessile, flat, or keeled, quite entire, or ciliated by a few stiff hairs, 1-nerved or many-nerved at the base: the narrower ones nerveless. Flowers terminal, solitary, sessile. This is a very shewy genus of plants.

1 L. DIOSMOIDÉUM (from Diosma, an idea, similar; plants with the habit of Diosme). D. C. prod. 3. p. 102. Leaves ciliated with stiff bristles.

1 L. CATAPHÉRÉTTA (D. C. l. c.) shrubby, dichotomous, or trichotomous; branches somewhat tetragonal, loricated; leaves sessile, half stem-clasping, keeled, having the middle nerved and nerve-formed margins serrated from stiff bristles, the rest quite glabrous and stiff; flowers terminal, sessile, solitary; tube of calyx ovate, shorter than the lobes, which are 6 lanceolate, and ciliately serrated; anthers dissimilar. h. s. Native of Brazil, on Serro Frio, in marshes, at the height of 4000 feet. Rhéxia cataphética, Schrank, et Mart. miss. Allied to L. imbriéa, but the leaves spread more, and the branches are less squarrose; more nearly allied to L. insigüis, but the leaves are shorter and more crowded, and the cilius of the calyx is not glandular. Perhaps referrible to Axinæa.

Chiarus Lavoisiæa. Shrub 1 to 2 feet.

2 L. IMBRICATA (D. C. l. c. p. 103.) shrubby, quite glabrous; branches somewhat tetragonal; leaves imbricated, in 4 rows,
MELASTOMACEÆ.

IV. Lavoisiera.

sessile, ovate, 1-nerved, having the nerve-formed margins ciliated with stiff bristles; flowers terminal, solitary, sessile; tube of calyx turbinate, bristly, 6-lobed; lobes drawn out into an obovate, scarious appendage each; anthers dissimilar. Ê. S. Native of Brazil, among rocks. Rhéxia blepharocentra liliata or floribunda, Mart. herb. Rhéxia imbricata, Thumb. diss. pl. bras. l. p. 10, t. 2. f. 2. Bibl. icon. 1817. ex flora, 1821. p. 331. Leaves shining, when dried yellowish. Petals obovate. Stamens 12, shorter than the petals. Anthers ovate-oblong, terminating in a short beak, with the connectives drawn out into a blunt appendage at the base.

Imbricated-leaved Lavoisiera. Shrubs 1 to 2 feet.

3 L. cómpa (D. C. l. c.) shrubby, nearly quite glabrous; branches terete; leaves sessile, imbricated in 4 rows, stiff, keeled, acuate, hairy, the middle nerve roughish, and the nerve-formed margins serrately ciliated; flowers terminal, solitary, sessile; tube of calyx villous, turbinated, with the lobes ovate-oblong, acute, and entire; anthers dissimilar. Ê. S. Native of Brazil, in the province of Minas Geraes, on the tops of a chain of mountains called Morro de Villa Rica, and elsewhere. Rhéxia cómpa, Mart. et Schrank, mss. Very like L. imbricata.

Neat Lavoisiera. Shrub 1 to 2 feet.

4 L. ixiosis (D. C. l. c.) shrubby, quite glabrous; branches slender, rather tetragonal; leaves sessile, lanceolate, keeled, usually 1-nerved, imbricated in 4 rows, having the nerve-formed margins ciliated with stiff bristles; flowers terminal, solitary, sessile; tube of calyx turbinate, 6-lobed; lobes oblong, acute, ciliately serrated; anthers dissimilar. Ê. S. Native of Brazil. Very like L. imbricata, but differs in the leaves being longer, less adpressed, and more acute, in the petals being ciliated at the apex, and in the different calyx. Stamens as in L. imbricata. Capsule 5-celled, permanent, dehiscing from the base as in L. mucorífera. D. C. coll. 1. t. 2.

Shoe Lavoisiera. Shrub 1 to 2 feet.

5 L. viminális (D. C. l. c.) shrubby, glabrous; branches twitty, tetragonal; leaves sessile, adpressed, lanceolate, many-nerved, striated, ciliated with bristles; floral leaves setose beneath; flowers terminal, few, aggregate, almost sessile; calyx hispid, turbinate, 5-toothed; teeth long, acuminate; anthers dissimilar. Ê. S. Native of Brazil in, alpine fields on Serra de Sincora, at the height of 4500 feet. Rhéxia viminális, Mart. et Schrank, mss. Leaves stiff, imbricate. Petals large, purple. Anthers 10, oblong, yellow, beaked, 5 of which are furnished with an obtuse appendage at the base. Allied to L. imbricata.

Twitty Lavoisiera. Shrub 1 to 2 feet.

§ 2. Mucoríse (from mucor, mouldiness; appearance of bristles). D. C. prod. 3. p. 103. Leaves flat, ciliated, with villi or soft hairs.

6 L. mucorífera (D. C. l. c.) shrubby; branches tetragonal, puberulous; leaves sessile, lanceolate, ovate at the base, acuminate, quite entire, setosey ciliated, 7-nerved, the middle nerve bristly beneath, the lateral ones hardly perspicuous; flowers terminal, solitary, sessile among the leaves; tube of calyx subglobose, 5-7-lobed; lobes linear, acuminate, ciliated, deciduous; anthers dissimilar. Ê. S. Native of Brazil, in the province of Minas Geraes, in alpine fields at 2000 or 3000 feet above the level of the sea. Rhéxia mucorífera, Mart. et Schrank, mss. Setae for the most part pellucil, and terminated by a globular each, and therefore mucoríferus. Petals obovate-oblong. Anthers 10-14, oval-oblong, terminating in an oblique porose beak, having the connective drawn out in some into a long appendage at the articulation, in others into a short appendage. Capsule 5-7-celled, opening from the base. Seeds angular.

Mucoríseus Lavoisiera. Shrub 1 to 2 feet.

§ 3. Carináte (from carina, a keel; leaves keeled). D. C. prod. 3. p. 103. Leaves glabrous, not ciliated, keeled, not flat.

7 L. tetragóna (D. C. l. c.) shrubby, glabrous, usually dichotomously branched; branches terete; leaves sessile, keeled, densely imbricated, in 4 rows, bluish, destitute of hairs and cilia, quite entire, stiff, 1-nerved. Ê. S. Native of Brazil, on the top of Mount Itambe. Rhéxia tetragóna, Mart. et Schrank, mss. Flowers and fruit unknown. Like the rest the flowers are seen to be sessile, terminal, and solitary. In habit it agrees with L. imbricata.

Tetrágona Lavoisiera. Shrub 1 to 2 feet.

8 L. áleba (D. C. l. c.) shrubby, quite glabrous; branches and stem tetragonal; leaves sessile, half stem-clasping, broadly ovate, 9-nerved, quite entire; flowers axillary, solitary, on short pedicles, when young involved in 2 bracteas; tube of calyx somewhat cylindrical, longer than the lobes, which are 5-6, oblong, and acute; anthers rather dissimilar. Ê. S. Native of Brazil, on the mountains between Villa Rica and Tejuco, in stony, exposed places. Rhéxia álba, Mart. et Schrank, mss. Flowers large, white. Petals 5-6, oval-oblong. Anthers 10-12, ovate, terminating in a short and blunt beak, having the connective in 5-6 of them drawn out into a long, somewhat 2-lobed appendage each at the articulation, and in the other 5-6 hardly produced at all.

White-flowered Lavoisiera. Shrub 1 to 2 feet.

9 L. gentianoides (D. C. l. c. p. 104.) shrubby; stem and branches tetragonal, glabrous; leaves sessile, half stem-clasping, lanceolate, acuminate, quite entire, many-nerved: the upper and young ones are setose and ciliated; flowers terminal, crowded, on short pedicles; calyx bristly, with the tube cylindrical; and the lobes 5, apiculate by pili, about equal in length to the tube; anthers dissimilar. Ê. S. Native of Brazil, in the province of Minas Geraes, in high rocky places. Rhéxia gentianoides, Mart. et Schrank, mss. Habit almost of Gentiana se-ponaria. Flowers white. Petals somewhat joined at the base. Anthers 10, ovate, terminating in a short blunt beak, in 5 of them the connective is long and tumid at the articulation, in the other 5 short and hardly arched.

Gentian-like Lavoisiera. Shrub 1 to 2 feet.

10 L. crassifólia (D. C. prod. 3. p. 104.) shrubby, dichotomously branched, quite glabrous; branches terete; leaves sessile, half stem-clasping, ovate, approximate, stiff, quite entire, 1-nerved; lateral veins obsolete; flowers terminal, solitary, sessile; tube of calyx broad, turbinated, much longer than the lobes, which are broad, mucronate, and very short; anthers dissimilar. Ê. S. Native of Brazil, on Serro Frio. Rhéxia crassifólia, Mart. et Schrank, mss. Petals 6, obovate, purple, thickish. Anthers terminating in a very short beak, in some the connective is very long and arched, in others short.

Thick-leaved Lavoisiera. Shrub 2 to 4 feet.

11 L. punctata (D. C. l. c.) shrubby, dichotomous, quite glabrous; branches tetragonal; leaves sessile, half stem-clasping, lanceolate, quite entire, many-nerved, beset with brown dots beneath, 5 of the nerves are much elevated; flowers terminal, solitary, sessile; tube of calyx 16-ribbed, cylindrical, twice the length of the lobes, which are 5, and lanceolate; anthers 10-16, dissimilar. Ê. S. Native of Brazil, in high cold fields. Rhéxia punctata, Mart. et Schrank, mss. Petals ample, obovate-oblong, purple. Stamens much shorter than the petals, the
alternate ones having longer connectives than the others. Anthers bluntly beaked. Cells of capsule equal in number to the petals.

**Dotted-leaved Lavoisiera.** Shrub 1 to 2 feet.

12 L. *Itambena* (D. C. L. c.) shrubby, dichotomous, quite glabrous; branches rather angular; leaves sessile, imbricated in 4 rows, ovate, hardly stem-clasping, attenuated at both ends, rather serrated, 1-nerved, lateral veins almost obsolete; flowers terminal, solitary, sessile; calyx dotted with white, having a broad turbinate tube, and 6-7 oval lobes, which are about equal in length to the tube; anthers dissimilar. (fragment)

**Native** of Brazil, on the high mountains of Itambé and Serro Frio in the province of Minas Geraes. Rhéxia *Itambena*, Mart. et Schrank, miss. Petals obovate-oblong, much longer than either the calyx or stamens. Anthers like those of *L. pavonata*.

**Itambé Lavoisiera.** Shrub 1 to 2 feet.

13 L. *firma* (D. C. L. c.) shrubby, branched, almost quite glabrous; branches bluntly tetragonal; leaves sessile, half stem-clasping, ovate, acutish, quite entire, 1-nerved, lateral veins almost obsolete; flowers terminal, solitary, sessile; tube of calyx cylindrical, rather ribbed; limb campanulate, 6-cleft; anthers dissimilar. (fragment)

**Native** of Brazil, on the high mountains of Itambé and Serro Frio. Rhéxia *firma*, Mart. et Schrank, miss. Leaves few, beset with scattered glandular bristles in the disk and on the edges, the rest quite glabrous.

**Firma Lavoisiera.** Shrub 2 to 4 feet.

14 L. *pulcherrima* (D. C. L. c. p. 104.) shrubby, dichotomous, quite glabrous; branches nearly terete, rather glaucous; leaves sessile, half stem-clasping, ovate-lanceolate, acute, quite entire, many veined, with 3 of the veins more elevated than the rest; flowers terminal, solitary; tube of calyx ovate, twice the length of the lobes, which are 6-10 ovate, acute; anthers dissimilar. (fragment)

**Native** of Brazil, in the province of Minas Geraes, in elevated fields. Rhéxia pulcherrima. Mart. et Schrank, miss. Leaves deflexed. Flowers purple. Anthers ovate, with short blunt beaks, the alternate ones with long connectives, which are tenuis at the base.

**Very-fair Lavoisiera.** Shrub 2 to 4 feet.

15 L. *lineolata* (D. C. L. c.) shrubby, much branched, glabrous; leaves on short petioles, linear, quite entire, nerveless; flowers solitary, almost sessile, axillary or terminal; tube of calyx tubinate, beset with glandular dots, shorter than the lobes, which are subulate; petals obovate, when young apiculate; anthers dissimilar. (fragment)

**Native** of Brazil in moist meadows, in the province of Minas Gerares, at Serro Frio. Rhéxia *lineolata*, Mart. et Schrank, miss. Anthers 10, oblong, terminated by a blunt apex, in 5 of them the connective is rather long, and hardly tenuis at the articulation, in the other 5 it is drawn out into a blunt appendage.

**Flax-leaved Lavoisiera.** Shrub 1 to 2 feet.

**Cult.** See *Meriana* for culture and propagation, p. 733. All the species are delicate elegant plants, well deserving cultivation.

**V. DAVY** (named by De Candolle in honour of the celebrated chemist, Sir Humphry Davy). D. C. prod. 3. p. 105.

**Lin. syst.** Deca-Dodecandra, Monogynia. Calyx with a campanulate or ovate-oblong tube; teeth 10-12, connected into a membranous entire limb. Petals 5-6. Anthers beaked, opening by one pore, having the connectives drawn out into an elongated simple spur, which is sometimes furnished with 2-3 bristles at the apex. Ovaryum free, globose or oblong, depressed and glabrous at the apex. Style filiform. Capsule 5-celled. Seeds unknown.—Shrubs or trees, natives of South America, with the habit of *Banatiera*. Leaves petiolate, oval, 5-nerved, almost glabrous. Flowers corymbose or panicled, yellow. The calyx agrees with *Meriana*, but the habit and colour of the flowers are different.

1 D. *paniculata* (D. C. L. c.) branches terete, tomentose at the apex, as well as the petioles and middle nerve of the leaves, from thick fasilates of philt; leaves petiolate, ovate, acuminate, quite entire, 5-nerved, glabrous, except on the middle nerve; coryumbs terminal, trifid at the base; pedicels subumbellate; tube of calyx ribbed, campanulate; anthers 10, of which are furnished with a somewhat spatulate obuse spur each, and the other 5 with a shorter, somewhat cylindrical spur each. (fragment)

**Native** of Brazil, in woods near Rio Janeiro. Rhéxia *paniculata*, Mart. herb. but not Buch. Petals 5-6, yellow, obovate. Alternate anthers longer, with the appendages copper-coloured.

**Panicled-flowered Davya.** Shrub 2 to 4 feet.

2 D. *olafrica* (D. C. prod. 3. p. 105.) quite glabrous in every part; branches bluntly tetragonal, hardly terete; leaves petiolate, elliptic, attenuated at the base, acuminate at the apex, 3-nerved, quite entire; raceme terminal, somewhat panicled, few-flowered; calyx campanulate, bluntly 5-lobed; anthers with a long copper-coloured spur each. (fragment)

**Native** of Brazil. Flowers yellow.

**Glabrous Davya.** Shrub 2 to 3 feet.

3 D. *guianensis* (D. C. L. c.) branches teretely tetragonal, clothed with deciduous brown bristles down, as well as the petioles, panicules, and leaves when in a young stage; leaves petiolate, ovate, acuminate, somewhat crenulate, 5-nerved; nerves beset with rufous bristles, the rest glabrous; panicle terminal, with its branches many-flowered and umbelliferous at the apex; tube of calyx oval-oblong, somewhat urceolate; spurs of anthers bearing many bristles at the apex. (fragment)

**Guiana Davya.** Tree 20 feet.

4 D. *peruviana* (D. C. prod. 3. p. 105.) branches somewhat compressedly terete, hardly terete; petioles, panicules, and young leaves clothed with powdery flocy down; leaves on long petioles, ovate, quite entire, abruptly acuminate, 5-nerved; panicule terminal, having its branches opposite and many-flowered, and its branches 3-flowered; calyx bluntly 5-toothed. (fragment)

**Native** of Peru, near Cochera. Petioles nearly 2 inches long.

**Peruvian Davya.** Shrub to 6 feet.

**Cult.** See *Meriana* for culture and propagation, p. 733. Plants worth cultivating for their beauty.

VI. GRAFFENRIE'DA (this name has been given by De Candolle to recall the labours of Fr. L. de Graffenried, editor of J. Batham's Historie Plantarum). D. C. prod. 3. p. 105.

**Lin. syst.** Decandra, Monogynia. Tube of calyx oblong; its limb campanulate and bluntly 5-toothed. Petals 5, obovate. Stamens 10; anthers linear, acute, opening by one pore, furnished with a simple appendage at the base. Style filiform. Ovaryum free, not bristly at the apex, but furnished with something like 5 tubercles. Capsule ovate, 5-valved, opening at the apex. Seeds angular, straight.—Shrubs, with the habit almost of *Diplóëcita*, but differs in the bracteae being absent, in the fruit dehiscing at the apex, and in the different formed appendages of the anthers.

1. Anthers furnished with a setaceous appendage each. Teeth of calyx very short and blunt. Fruit not umbilicate at the apex.

1 G. *rotundifolia* (D. C. L. c.) branches terete, glabrous; leaves short petioles, orbicular, somewhat cordate, quite entire, glabrous and shining above, but powdery beneath, 5-nerved, the lateral nerves approximating the margin; thyrse panicked,
MELASTOMACEÆ. VI. Graffenrieda. VII. Centronia. VIII. Truncaria. IX. Rhynchanthera.

terminal; petals 5, obovate. ɔ S. Native of New Andalusia, near Caripe. Rhéxia rotundifólia, Bonpl. rhex. t. 25. Flowers rose-coloured.

Round-leaved Graffenrieda. Shrub 3 to 6 feet.

2 G. excélsa (D. C. l. c.) branchlets tetragonal; peduncles, petals, and under side of leaves clothed with velvety rufescent down; leaves on long petioles, oval, 7-nerved, crenulated, blistered above, glabrous; thyrse panicked, terminal; bracteas 2 under each flower. ɔ S. Native of South America, in shady places near Loxa. Rhéxia excélsa, Bonpl. rhex. t. 54. Osbéckia excélsa, Spreng. syst. 2. p. 312. Stems numerous from the same root, herbaceous, 6-10 feet high. The flower-bud or alabastrum almost like that of Conostégia, but differs in being clft longitudinally. Flowers red.

Tall Graffenrieda. Pl. 6 to 10 feet. Cult. See Meriānia, p. 733. Elegant plants, which deserve to be cultivated in every collection of stave plants.

VII. CENTRONIA (from κέφων, kephon, a spur; anthers furnished with a long spur each). D. Don, wern. mem. soc. 4. p. 314. D. C. prod. 3. p. 106.

1 C. laurifólia (D. Don, in wern. soc. mem. 4. p. 315.) ɔ S. Native of Peru, in groves. Osbéckia Peruvianá, Ruiz et Pav. in herb. Lamb.

Laurel-leaved Centronia. Treec.

Cult. See Meriānia, p. 733. for culture and propagation. An elegant shrub when in flower.

VIII. TRUNCARIA (from trunco, to lop off; limb of calyx truncate). D. C. prod. 3. p. 106.

L. syst. Decándria, Monógnýia. Tube of calyx cylindrical, hardly turbinate; limb truncate, nearly entire. Petals 5, ovate. Stamens 10; anthers elongated, beaked, opening by 1 pore, without any auricles. Ovarium altogether free in the bottom of the calyx, 10-sided, and somewhat cup-shaped at the apex. Style filiform. Stigma hemispherical. Fruit unknown.—A climbing Brazilian shrub. It differs from Medinilla in the quinary number of its parts, and in the free ovary; from Micócia in the cylindrical calyx; and from Meriānia in the absence of bracteas to the flowers.

1 T. carystophylëa (D. C. l. c.) branchlets bluntly tetragonal; pedioles and peduncles nearly glabrous; leaves oval, somewhat cumate at the base, and mucronately acuminate at the apex, 5-nerved, quite entire, ciliated, rather pilose on both surfaces; thyrse terminal, elongated, having its branchlets 3-flowered, with some bristles under the flowers holding the place of bracteas. ɔ S. Native of Brazil, in the province of Para. Melástoma or Meriānia truncáta, Schrank et Mart. ms. Flower-bud or alabastrum almost like that of the clove. Calyx quite glabrous. Close-budded Truncaria. Shrub cl.

Cult. For culture and propagation see Meriānia, p. 733. A plant worthy of cultivation.

IX. RHYNCHANThERA (from ῥυχνός, rhynchos, a beak, and ὀνήρ, anthera, an anther; anthers terminating by a long beak each). D. C. prod. 3. p. 106.—Rhéxia species, Bonpl. Schrank et Mart. ms. Ser. ms. —Proboseidia, Rich. herb.

L. syst. Decándria, Monógnýia. Tube of calyx ovate-globose; lobes 5, linear or setaceae. Petals 5, obovate. Stamens 10, 5 of which bear ovate, long beaked anthers, having their connectives long and auricled at the base; the other 5 are castrated and smaller. Ovarium ovate-globose, glabrous. Capsule 3, but usually 5-celled. Seeds angular or oblong.—Sub-shrubs or herbs, natives of South America. Branches terete or bluntly tetragonal, hairy or pilose. Leaves cordate or oblong, 5-9-nerved. Peduncles axillary, cymose, usually disposed in a terminal thyrse. Flowers purple, not involved by bracteas when young.

* Leaves cordate.

1 R. grandiflóra (D. C. prod. 3. p. 107.) branches terete, and are, as well as the petioles, clothed with glandular pili; leaves on long petioles, cordate, somewhat denticulate, hairy, 9-nerved; flowers tern at the tops of the branchlets; tube of calyx subglobose, shorter than the teeth, which are setaceous. ɔ S. Native of Cayenne, and near the Orinoco, in wet meadows. Melástoma grandiflóra, Aubl. guian. 1. p. 414. t. 160. Rhéxia grandiflóra, Bonpl. rhex. t. 26. t. 11. Osbéckia Aubletiána, Spreng. syst. 2. p. 311. Tube of calyx purple. Genitalia hardly longer than the petals. The flowers are fertile, but the 5 sterile ones reduced to threads. Calyx hispid. Perhaps the plant of Bonpland is the same as that of Aublet.

Great-flowered Rhynchanthera. Shrub 3 to 5 feet.

2 R. novemétria (D. C. l. c.) shrub oppositely branched; branches nearly terete, beset with glandular bristles; leaves petiolute, cordate, ovate, somewhat acuminate, crenated, 9-nerved, hardly pilose above, but villous beneath; flowers solitary, in the axils of the bracteas, almost sessile, disposed in something like racemes; tube of calyx hairy, globose, equal in length to the lobes, which are linear-setaceous. ɔ S. Native of Brazil, in marshes in woods. Flowers purple. The 5 longest anthers have a flat long connective each, and the 5 shortest ones have a terete short connective each. Capsule nearly globose, 3-celled, 3-valved. Seeds ovate, reticulately dotted.

Nine-nerved-leaved Rhynchanthera. Shrub 2 to 4 feet.

3 R. dichótomà (D. C. l. c.) shrubby; branches somewhat tetragonal; petioles and calyces rather hispid; leaves petiolute, cordate, ovate, acute, serrated, 7-9-nerved, puberulous on both surfaces; peduncles axillary and terminal, panicled, dichotomous, leafy; tube of calyx ovate; lobes subulate-lanceolate; 5 of the anthers are acuminate by a beak, longer than the connective, which is auricled at the base. ɔ S. Native of Brazil, in marshes about Rio Janeiro; and of St. Christopher. Melast. dichótomà, Desv. in Lam. Dict. 4. p. 41. Rhéxia Christopherínea, Schrank et Mart. ms. Petioles 9-10 lines long. The pili on the upper side of the leaves are scattered and large, under side villous along the nerves and veins. The hairs of the calyx often glandular. Seeds obtuse.

Dichotomous Rhynchanthera. Shrub 3 to 5 feet.

4 R. cordàta (D. C. l. c.) suffrutescent, simple; stem nearly terete, hispid from long spreading hairs; petioles short, slender, hispid; leaves cordate, ciliately-serrate, acute, 7-9-nerved, setose on both surfaces; thyrse panicked, elongated, terminal; racitis, calyces, and peduncles beset with glandular hairs. ɔ S. Na-

Cordate-leaved Rhynchanthera. Shrub 1 to 2 feet.

5 R. Henkeana (D. C. I. c.) shrubby; branches terete, hairy, densely clothed with glandular down at the apex; leaves on short petioles, cordate, somewhat peltate, acuminate, serrated, 7-nerved, rather pilose above, and hairy beneath, having the serratures ciliately serrated; flowers cymosely corimbosus, terminal; tube of calyx ovate, pilose, shorter than the lobes, which are 3, and setaceous, 5 of the anthers furnished with long beaks. flies. S. Native of Peru. Melastoma grandiiflora, Schrank, ss. Melastoma Henkeana, Mart. ss. Leaves 3 inches long. Petioles 2 lines long. Flowers large, purple, like those of R. grandiiflora. Five of the anthers are hardly longer than their elongated beak, but a little longer than their connective, which is tumid at the articulation; the others abortive, and changed into liguule. Ovarium free.

Henke's Rhynchanthera. Shrub 1 to 2 feet.

6 R. Schrankiana (D. C. I. c.) shrubby; branches terete, hispid from unequal glandular stiff hairs; leaves petiolate, cordate, acuminate, serrated, 5-nerved, hairy on both surfaces; pedicels axillary, 1-flowered; tube of calyx ovate, hairy, shorter than the lobes, which are 3 and linear; anthers 5, of which are short and castrated, the other 5 bearing long beaks. 8 S. Native of Brazil, in the province of Minas Geraes, in marshes on the mountains. Rhoxia Schrankiana, Mart. herb. Very like R. grandiiflora and R. Henkeana; from the first it differs in the pentamerothamorous flowers, and from the last in the petals being axillary and solitary.

Schrank's Rhynchanthera. Shrub.
7 R. monodynana (D. C. I. c.) branches terete, hispid from long spreading bristles, as well as the petioles, peduncles, and calyces; leaves petiolate, cordate, ovate, acuminate, toothed; pilose on both surfaces, 7-nerved; pedicels axillary, 1-5-flowered; lobes of calyx setaceous, longer than the tube; five of the stamens are antheriferous, one of them twice the size of the others. flies. S. Native of Brazil, in the province of Para, in woods, and along the river Amazon. Melastoma foetidigorii, Schrank et Mart. ss. Capsule 5-celled. A very distinct species. The specific name is derived from monos, one, and dynamos, power; in reference to the long stamen.

Monodynamous Rhynchanthera. Shrub.
8 R. pentanthera (D. C. I. c.) shrubby; branches rather tetragonal, beset with glandular pili; leaves petiolate, ovate, acuminate, rather cordate at the base, ciliately serrated, 7-nerved, rather pilose above, but hairy on the nerves beneath; lanceolate, terminal; calyx rather pilose, at length glabrous, with an ovate tube; and 5 subulate lobes, which are broadest at the base, and longer than the tube; the 5 barren stamens filiform, the 5 fertile ones having the anthers bearing long beaks. flies. S. Native of Brazil, in the province of Minas Geraes, in marshes and woods. Rhoxia pentanthera, Schr. et Mart. ss. Flowers purple. Anthers oval, hardly longer than the beaks. Capsule 5-celled. Allied to Henkeana.

Five-anthered Rhynchanthera. Shrub 1 to 2 feet.

9 R. mexicana (D. C. I. c.) shrubby; branches tetragonal, hairy; leaves petiolate, ovate, acuminate, somewhat cordate at the base, ciliately serrated, 7-9-nerved; pedicels axillary, opposite, longer than the petals, hairy, 1-flowered, each bearing 2 lanceolate-linear leaves; anthers 5, equal. flies. S. Native of Mexico. Thenardia rosa, Moc. et Sesse, fl. mex. icon. ined. Flowers elegant, rose-coloured. Petals mucronate. Capsule 4-valved.

Mexican Rhynchanthera. Shrub 4 to 6 feet.

* * Leaves shorter than that of the preceding division, not cordate at the base, petiolate or sessile.

10 R. limosa (D. C. I. c.) shrubby, erect, branched; branches nearly terete, clothed with glandular hairs; leaves lanceolate, on short petioles, acuminate, bluntly subcordate at the base, serrulately, 5-7-nerved, puberulous on both surfaces, paler beneath; thyrse terminal; calyx puberulous, with a globose tube; and 5 setaceous lobes, which are a little shorter than the tube; anthers 5, with long beaks; capsule 3-celled. flies. S. Native of Brazil, in the province of Bahia, in muddy places near Caiete. Meriânia violacea, Schranks. ss. Rhoxia limosa, Mart. herb. Leaves like those of Cistus Monspeliaceus. Flowers purple, like those of R. grandiiflora. Capsule globose. Seeds numerous, angular.

Muddy Rhynchanthera. Shrub.

11 R. rostrata (D. C. I. c.) shrubby; branches nearly terete, clothed with glandular bristles; leaves petiolate, oblong, bluntish at the base, acuminate at the apex, ciliately serrulately, 5-nerved, pilose above, and rather hairy on the nerves beneath; cymes axillary and terminal; calyx hairy, with an oblong tube; and 5 setaceous lobes, which are a little shorter than the tube; stamens 10, 5 of which are barren, and 5 bearing long, beaked anthers. flies. S. Native of Brazil, on the sides of the mountains called Serra St. Antonio. Rhoxia rostrata, Schrank et Mart. ss. Flowers violaceous. Filaments glabrous.

Beaked Rhynchanthera. Shrub 1 to 2 feet.

12 R. Fothergillii (D. C. I. c.) shrubby; branches somewhat tetragonal; petioles and pedicels densely clothed with bristles; leaves petiolate, oblong, acuminate at the base, acuminate at the apex, 5-nerved, quite entire, beset with adpressed bristles above, but with villi beneath; racemes short, terminal; flowers pedicellate, when young involved in 2 bracteas; calyx strigose, with a campanulate tube, and 5 triangular acute lobes; anthers dissimilar. flies. S. Native of Brazil, in the provinces of St. Paul and Minas Geraes, in low woods. Rhoxia Fothergillii, Schrank et Mart. ss. Allied to R. grandiiflora. Petals large, nearly orbicular, purple. Anthers arched, wrinkled transversely, 5 with a drawn out connective, and the other 5 with a short hardly tumid connective each. Filaments rather pilose.

Fothergill's Rhynchanthera. Shrub 1 to 2 feet.

13 R. stachydimorpha (D. C. I. c.) suffruticosus; branches tetragonal, rather hairy; leaves on short petioles, ovate-lanceolate, acute, quite entire, 5-nerved, clothed with adpressed pili on both surfaces; peduncles axillary, few-flowered, disposed into an elongated leafy thyrse; flowers deciduous; calyx with an ovate tube, and setaceous ciliated lobes. flies. S. Native of Brazil, in high grassy fields about Minas Novas. R. stachyoides, Schrank et Mart. ss. but not of Humb. et Bonpl. Petals red. The 5 stamens, with the long filaments, bear elongated anthers, which have their connectives not drawn out, but with their beaks dilated at the apex. Seeds irregular, usually oblong-conical, truncate at the base, and reticulated in general.

Spike-formed Rhynchanthera. Shrub 1 to 2 feet.

14 R. serrulata (D. C. I. c.) plant herbaceous, erect, claemy; branches bluntly tetragonal, rather hairy; leaves almost sessile, attenuated at both ends, linear-lanceolate, serrulately, 5-nerved; flowers axillary and terminal, solitary, on short pedicels; tube of calyx rather hairy, with rather longer linear lobes; 5 of the stamens sterile; capsule 3-celled. flies. S. Native of Guiana, in meadows. Rhoxia serrulata, Rich. in Bonpl. rhex. t. 28, but not of Nutt. Flowers deep purple. 

Serrulately-leaved Rhynchanthera. Pl. ½ foot.

15 R. salicifolia (Mart. herb. Schrank, ss. ex D. C. prod. 3. p. 109.) plant herbaceous; stem nearly simple, puberulous, 5 B
tetragonal at the apex; leaves on short petioles, serrulate, 3-nerved; middle ones linear; upper ones lanceolate or obovate; flowers axillary, on short pedicles, solitary; tube of calyx ovate, pilose, shorter than the lobes, which are 5, acute and linear. C. S. Native of Brazil, in the province of Bahia in low moist fields. Root fibrous. Leaves sparingly pilose. Anthers linear, falcate, beaked: having their connectives tumid at the articulation, and shortly auricled, not half the length of the anthers; filaments flat.

*Willow-leaved Rhyneanthera.* Pl. 1 foot.

*Cult.* The species of *Rhyneanthera* being natives of marshes and bogs require to be kept moist, especially through the summer; for this purpose the pots in which the species are grown should be kept in pans filled with water; in other respects their culture and propagation is the same as that of *Meriânia*, see p. 792.

**X. MACAIREA** (dedicated by De Candolle to M. Isr. Macaire, who has published in the Memoirs of the Natural History Society of Geneva, some curious remarks upon the influence of narcotic poisons upon living vegetables, &c.) D. C. prod. 3. p. 109.

*Lin. syst.* octandria, monogynia. Tube of calyx ovate; lobes 4, permanent. Petals 4, obovate. Stamens 8, unequal; the 4 longer ones bearing one series of glands on the inner side at the apex; the 4 shorter ones smoothish. Anthers linear, elongated, opening by one pore, in the longer ones the connectives are elongated and stipel-formed, but in all unequally dilated at the base. Ovarium free, ovate, beset with glandular bristles. Style filiform. Capsule 4-celled, clothed by the calyx. Seeds ovate, somewhat truncate at the hilum. South American shrubs, with terete branches. Petioles and young leaves clothed with rufous villi. Leaves petiolate, ovate, mucronate, coriaceous, quite entire, glabrous above, but rather velvety beneath even in the adult state, at first sight feather-nerved, but there is sometimes a marginal nerve on each side; in this case the leaves are somewhat 3-nerved. Thrys of flowers panicled and very villous. Flowers white, according to the dried specimens. This genus is analogous to *Lasiantra*, but differs from it in the flowers being ooctandrous, and in the seeds being ovate.

1. *Myrtisflora* (D. C. l. c.) branchlets terete, clothed with short adpressed rufous down; leaves petiolar, oval, rotundate, glabrous above, but clothed with short rufous pubescence beneath, 3-nerved; lateral nerves slender, and approximating the margin of the leaf; thrys panicled; calyx clothed with adpressed short rufous down. C. S. Native of Brazil. *Thrys-flowered Macairea.* Shrub 5 to 6 feet.

2. *Rhus flacca* (D. C. l. c.) branches blantly tetragonal; petioles, panicles, calyxes, and young leaves clothed with long rufous villi; leaves petiolate, oval, coriaceous, glabrous above, but clothed with deciduous villi beneath, 3-nerved; lateral nerves slender, and near the margins of the leaf; thrys panicled; calyx villosus, with narrow acute lobes. C. S. Native of Brazil, in the province of Rio Negro, on mount Araracuara. Rhéxia anomala, Schrank et Mart. miss.

*Rhus-flowered* Macairea. Shrub 3 to 6 feet.

*Rasp-leaved* Macairea. Shrub 2 to 4 feet.

4. *Adenostemon* (D. C. l. c.) shrubby; branches nearly terete; petioles, peduncles, and calyces clothed with stiff villi; leaves petiolate, obovate, 3-nerved, echinated by strong stripe above, hairy beneath; panicle terminal; lobes of calyx 5, linear, subulate; filaments bearing stipitate glands. C. S. Native of Brazil, in fields near Salgada. D. C. coll. 1. t. 4. Lateral nerves near the edge of the leaf. Leaves obtuse, when young apiculated. Flowers small, purple. Anthers 8, having their connectives short and bisulcate at the base.

*Fur, fr by.* (Schrank et Mart. herb. ex D. C. l. c.) leaves oblong. C. S. Native of the province of Minas Geraes, in calcareous places.

**Glandular-stemmed Macairea.** Shrub 4 to 6 feet.

*Cult.* For the culture and propagation of the species of this genus see *Meriânia*, p. 733.

*Lin. syst.* octandra, monogyenia. Tube of calyx globose; lobes 4, nearly triangular, hardly acute, permanent. Petals 4, obovate. Stamens 8, equal; filaments glabrous; anthers oblong, opening by one pore at the apex, without auricles at the base; the connectives hardly perspicuous. Style filiform. Ovarium free, somewhat thickened at the tops of the valves, truncate, and furnished with 4 tubercles. Capsule 4-celled. Seeds cuneated, angular.—A shrub, native of New Granada. Branches clammy. Leaves on short petioles, elliptic, 3-nerved, smooth, almost quite entire. Pedicels tert at the tops of the branches. Habit of *Osbéckia* or *Arthrostromma*, but differs in the seeds being angular, not coelolate. Flowers violaceous.

*Clamyxy* Bucquetia. Shrub 4 to 6 feet.

*Cult.* For culture and propagation see *Meriânia*, p. 733.

*Lin. syst.* Decandria, monogyenia. Tube of calyx globose or obovate, hardly constricted under the limb; lobes 5, narrow, acute, permanent. Petals 5, obovate. Stamens 10; anthers equal in size and shape, linear, falcate, somewhat beaked, gibbously auricled at the base; having the connectives hardly perspicuous, and drawn out into an undivided obtuse auricle at the base, of various lengths. Style filiform. Capsule ovate, globose, 3-celled. Seeds angular or ovate, with the hynum linear.

—Brazilian shrubs, for the most part glabrous. Leaves sessile. Flowers sometimes purple, sometimes copper-coloured, as in *Tropicolum*.

1. *C. late-venosa* (D. C. l. c.) suffruticose; leaves sessile, nearly orbicular, cordate, ciliately fringed, serrated, blistered on the upper surface, reticulated by broad flat veins beneath, clothed with short velvety down on both surfaces; branches of cyme many flowered, opposite, divericate; flowers decandrous; tube of calyx ovate, coarctate at the apex, longer than the lobes, which are subulate. C. S. Native of Brazil, in the province of Minas Geraes, on mountains at the height of 3500 feet. Rhéxia Bucardia, Schrank, miss. R. late-venosa, Mart. herb. Flowers red, pedicellate. Calyx when young sparingly pilose. Stamens equal among themselves. Anthers falcate, gradually beaked. Seeds obovate, minutely tuberculated; the hynum linear.

*Broad-leaved* Cambesessedesia. Shrub 1 foot.

2. *C. puerperata* (D. C. prod. l. c.) shrubby, quite glabrous; leaves sessile, orbicularly reiform, quite entire, somewhat 5-
nerved, smoothish; cymes terminal, dichotomous; flowers deciduous; tube of calyx ovate, 3 times longer than the lobes, which are lanceolate. \( \varphi \). S. Native of Brazil, in the province of Bahia, at the elevation of 5000 feet. Rhêxia purpurâta, Schrænk et Mart. mss. Cymes subumbellate, and as if they were involucrated by the 2 upper leaves; the rest of the bracts small, and lanceolate. Petals scarlet. Anthers bluntly sagittate at the base.

**Purplish** Cambessedesia. Shrub 1 to 2 feet.

3 C. corymbosâ (D. C. L. c.) shrubby, leaves petiolate, oblong, acute, quite entire, 5-nerved, glabrous above, clothed with velvetyomentum beneath, and dotted from lancauce; flowers terminal, in cymose corymb, deciduous; petals acuminate. \( \varphi \). S. Native of Brazil, at Itamae, in the province of Minas Geraes, in bags. Rhêxia corymbosa, Mart. et Schrænk, mss. Branchlets tetragonal. Leaves 10-12 lines long, and 3-4 broad; the lateral nerves hardly distinct. Bracteas glabrous. Calyx glabrous; lobes 5, lanceolate-subulate. Petals red, acute. Anthers yellow, exserted, elongated, with the connectives not drawn out; filaments joined in the middle.

**Corymbosa**-flowered Cambessedesia. Shrub 1 foot.

4 C. balsamifera (D. C. L. c.) shrubby, quite glabrous; branches dichotomous, terete; leaves obovate, acutish at both ends, dotted, quite entire, 3-nerved, 4 terminal; lateral nerves very small; flowers terminal, solitary, deciduous. \( \varphi \). S. Native of Brazil, in the province of Bahia, on the tops of mountains, at the elevation of 4000 or 5000 feet. Rhêxia balsamifera, Mart. et Schrænk, mss. Leaves almost like those of *Phillyrea angustifolia*. Calyx bearing balsam; tube obovate; lobes acute. Petals purple. Anthers yellow, apicated by a beak: having the connectives short, and drawn out into an obtuse flat auricle each.

**Balsam-bearing** Cambessedesia. Shrub 1 to 2 feet.

5 C. sincorniss (D. C. prod. 3. p. 111.) shrubby, much branched, quite glabrous; branches somewhat tetragonal at the apex; leaves on very short petioles, oblong, acutish, quite entire, one-nerved, hardly 3-nerved at the base, beset with minute dots on both surfaces; flowers nearly terminal, axillary, almost sessile; tube of calyx cylindrically obovate, with 5 short teeth. \( \varphi \). S. Native of Brazil, on the alps of Serra de Sincora, at the elevation of 4000 feet. Rhêxia sincornis, Schrænk, mss. Rhêxia Sincorniss, Mart. herb. Leaves 4 lines long, and 14 broad. Petals purple, obovate, not ciliated. Anthers yellow, apicated by long beaks, twice the length of the connectives, which are expanded into an obtuse appendage each at the base. Genitalis not longer than the petals.

**Sincora** Cambessedesia. Shrub 1 to 2 feet.

6 C. crenulata (D. C. L. c.) shrubby, glabrous, clammy at the tops; branches tetragonally terete; leaves sessile, ovate, hardly 3 veined at the base, flat, length of the internodes, with glandular, hardly crenated, margins; flowers few, at the tops of the branches, disposed in cymose corymb; calyx with an ovate tube, and 5-6 linear acute lobes. \( \varphi \). S. Native of Brazil, in alpine meadows, particularly on Serro Froio. Rhêxia crenulata, Mart. et Schrænk, mss. Flowers purple. Anthers ovate. Petals ovate, beaked: with the connectives drawn out at the base into a crenate-spatulate ligula each. Capsule ovate, glabrous. Seeds unknown.

**Crenulate**-leaved Cambessedesia. Shrub 1 to 2 feet.

7 C. esvora (D. C. L. c.) plant suffruticose, erect, glabrous, branched from the base; branches somewhat tetragonal; leaves sessile, ovate-cordate, acute, sparingly serrated, 3-nerved; flowers on the short axillary branchlets, solitary, and therefore disposed in a leafy elongated thyrse; calyx tubinate, with 5 acute lobes; petals lanceolate, acute; anthers nearly alike. \( \varphi \). S. Native of Brazil, in grassy bogs, in the provinces of St. Paul, and Minas Geraes. Rhêxia Esvora, St. Hil. in Bonpl. rhex. t. 58. Rhêxia chamedrifolia, Schrænk et Mart. herb.

Very like *R. adamantium* in habit and colour of flowers, but differs in being glabrous in every part, in the petals being much smaller and of a different form, in the anthers being obtuse, and in their connectives not being drawn out.

**Ver. \( \beta \), ilicifolia** (D. C. prod. 3. p. 111.) stem simple, straight, terete, velvety; leaves ovate, in fascicles; thyrse spirate, cylindrical. \( \varphi \). S. Native of Brazil, in the province of Minas Geraes. Rhêxia ilicifolia, Schrænk et Mart. mss. Leaves 2 to 3 lines long; of those branches very short and nerveless, in fascicles. Flowers yellow; petals oval-oblong; anthers fusco-cent, elongated.

**Espora** Cambessedesia. Shrub 1 to 2 feet.

8 C. adamanâm (D. C. L. c.) suffruticose, branched, procumbent, beset with scattered glandular pili; branches tetragonal, pilose, woolly at the knots; leaves on short petioles, ovate-lanceolate, somewhat 5-nerved, rather ciliate serrated, and beset with glandular hairs; thyrse terminal, crowded; calyx tubinate, with very short cordate lobes; petals ovate, acute; anthers nearly similar. \( \varphi \). S. Native of Brazil, near Tejuco, in sandy places on the Diamond Mountains. Rhêxia adamanâm, St. Hil. in Bonpl. rhex. t. 60. Colour of petals almost like that of *Tropœolum*. Anthers 10, oblong, obtuse, 5 of which are rather gibbous at the base. Capsule ovate-oblong, 3-valved, pilose at the apex. Seeds half ovate.

**Adaman** Cambessedesia. Shrub procumbent.

9 C. hilariâna (D. C. L. c.) suffruticose, glabrous, ascending; branches tetragonal; leaves on short petioles, oblong-linear, bluntish, quite entire, or furnished with 1 or 2 teeth, 3-nerved, bearing smaller leaves in their axils; peduncles 1-flowered, axillary, and terminal; calyx bearing glandular hairs, ovate, with 5 broad short mucronate lobes; stamens rather dissimilar. \( \varphi \). S. Native of Brazil, in the province of Minas Geraes, in moist sandy places on the tops of the mountains. Rhêxia galoïdes, Schrænk et Mart. mss. Rhêxia Hilariana, Kunth in Bonpl. rhex. t. 56. Rhêxia suberôsa, Spreng. syst. 2. p. 308. Alluded to *R. adamanâm* in habit and colour of flowers, but differs from that species in the longer and narrower leaves, and in the much more loose panicle.

**St. Hilare's Cambessedia.** Shrub 1 to 2 feet.

10 C. bidentata (D. C. L. c.) suffruticose; branches tetragonal, divaricate; leaves lanceolate, in fascicles, glabrous, bidentate; corymb panicked; pedicels pilose; petals ovate, acuminate; calyx mucronated, 10-ribbed; ovarium 3-celled. \( \varphi \). S. Native of Brazil, at Barra da Vareda, in open fields. Rhêxia bidentata, Nees et Mart. nov. act. bonn. 12. p. 53. Said to be allied to *C. Hilariana*, and probably only a variety of that species according to Kunth.

**Bidentate** Cambessedesia. Shrub 1 foot.

**Cult.** See *Meriania* for culture and propagation, p. 733. All the species are small elegant shrubs, deserving cultivation.

XIII. CHÆTOSTOMA (from \( \chi r y s \), chaithe, a head of hair, and \( \sigma \), \( \sigma \), stem, a mouth; in allusion to the calyx, which is girdled by a ring of stiff hairs round the mouth under the lobes on the outside). D. C. prod. 3. p. 112.

**Lin. syst.** Octo-Deccandria, Monogyonia. Calyx with a somewhat obovate tubinate tube, girdled by a ring of stiff bristles on the outside under the lobes; limb 4-5-lobed; lobes erect, pungent. Petals 4-5. Anthers with very short 1-pored beaks: having their connectives not drawn out at the articulation, and hardly gibbous. Capsule prismatic, longish, 4-5-angled. Seeds unknown.—Brazilian heath-like quite glabrous sub-shrubs. Stems slender. Leaves crowded, dry, 1-nerved, acute, quite entire, small. Flowers terminal, solitary. The habit of this genus is very distinct, but its normal characters are not well known.

5 in 2
* Flowers 5-cleft, decandrous. Capsule prismatic.

1 C. *fu'agens* (D. C. l. c.) shrubby, quite glabrous; leaves sessile, triangular, stiff, pungent, imbricate, quite entire, 3-nerved; lateral nerves hardly perspicuous; flowers terminal, solitary, decandrous; lobes of calyx spinulose. [22x165] 3-valved, ovate, acute, and parietal. *S. Native of Brazil, Smith. *Native of Brazil, in the province of Minas Geraes, on Serra Frias.* Rhynia pungens, Mart. et Schrank, sess. Branches slender, terete. Leaves 2-3 lines long, having the middle nerve thick. Lobes of calyx lanceolate, pungent; spinules rising from the top of the tube. Petals purple. Stamens yellow, 5 shorter than the others; filaments jointed in the middle; connectives not drawn out. Perhaps the same as Rhynia armata, Spreng. syst. 2. p. 308.

Pungent-calyxed Chaetostoma. Shrubs 1 to 2 feet.

* Flowers 4-cleft, octandrous. Fruit unknown.

2 C. *tetra'sticum* (D. C. l. c.) shrubby, glabrous, erect; leaves sessile, triquetrous, stiff, acute, keeled, imbricated in 4 rows; flowers terminal, solitary, octandrous; calyx glabrous, but with a ring of stiff hairs under the teeth. [22x183] 5-valved, ovate, acute, obtuse, and parietal. *S. Native of the Mountains.* Plant 6-8 inches long. Stems terete, slender. Leaves 2 lines long. Calyx campanulate, with an oblong tube, and 4 lanceolate teeth. Anters with short beaks, dilated at the base.

Var. *a, crassipes* (D. C. l. c.) caudex or root thick and tuberous, with numerous simple stems rising from it. Rhynia tetristicha, Mart. et Schrank, sess. [22x298] ovate, acute, obtuse, and parietal. [31x221] 5-valved, ovate-oblong, coarsely and ciliately toothed, 3-nerved, glabrous on both surfaces; cymes axillary and terminal; flowers numerous, secund along the branches of the cyme; calyx tubinate, attenuated at the base, 5-furrowed. [22x203] 5-valved, ovate-oblong, 8-furrowed, attenuated at the base, 8-furrowed. [23x137] 5-valved, ovate-oblong, 10-furrowed. [23x106] 5-valved, ovate-oblong, 12-furrowed. *C. Native of French Guiana.* Calyx 6-7 lines long when in fruit. Flowers in fascicles of 4 or 5.

Fascicled-flowered Salpinga. Pl. 1 foot.

+ A doubtful species.

3 C. *ericoïdes* (D. C. l. c.) shrubby; leaves sessile, opposite, somewhat decurrent, linear, complicated, ciliated; flowers terminal, solitary, octandrous; calyx bearded with bristles at the apex. [22x298] ovate, acute, obtuse, and parietal. [31x153] 3-valved, ovate, acute, obtuse, and parietal. [32x363] 4-valved, ovate, obtuse, and parietal. [33x136] 4-valved, ovate, obtuse, and parietal. [34x68] 4-valved, ovate, obtuse, and parietal. [35x327] 4-valved, ovate, obtuse, and parietal. [36x363] 4-valved, ovate, obtuse, and parietal. [37x127] 4-valved, ovate, obtuse, and parietal. *C. Native of French Guiana.* Calyx 1-3 lines long. Capsule trigonal: having the valves thickened and somewhat lid-formed at the apex, and bearing a dissepiment in the middle of each; column free.

Small-flowered Salpinga. Shrubs 1 to 2 feet.

Cult. The seeds of the annual species of this genus should be sown in pots, filled with a mixture of loam and sand, which should be placed in a hot-bed, and kept rather moist; and when the plants have attained 2 or 3 inches in height, they should be potted off into separate pots, and again placed into the hot-bed, where they may remain until they have ripened their seed, or be removed to the stove when in flower. The shrubby kind thrive well in the same kind of soil, and young cuttings of them root readily if planted in a pot of sand, with a hand-glass placed over them, in heat.

Lin. syst. *Decandria, Monogynia.* Calyx with a campanulate tube, and 5 obtuse lobes, which are usually very short and broad, and sometimes concreted into an entire limb. Petals 5, obovate. Stamens rather unequal; anthers ovate-obtuse, opening by 1 pore, attenuated at the base, and hardly or not auriculated. Ovarium not bristly. Capsule trigonal, 3-valved; valves as if they were retusely uncinated at the apex, and cut transversely under the apex, and therefore exhibiting the appearance of a lid. Seeds cuneate, trilocular, scabrous. —Brazilian, rooting herbs. Leaves stalked, ovate-like, 5-11-nerved, crenulated. Cymes corymbosous, terminal. Flowers white or purple.

1 B. *gymnepetala* (Raddi, l. c.) stem simple, short, creeping, glabrous; leaves petiolate, cordate, rather orbicular, undulately crenulated, 3-11-nerved, smoothish, white beneath;
corymbs pedunculate; limb of calyx hardly rose. 2. S. Native of the neighbourhood of Rio Janeiro, especially on the mountains called Serra d'Estrela, in humid places, in woods. Rhédia nymphaefólia, Kunth, in Bonpl. rhex. t. 53. Flowers white. Leaves 4 inches in diameter.

Water-lily-leaved Bertolonia. Pl. creeping.

2 B. ovata (D. C. prod. 3. p. 118.) stems very short, hairy, simple, creeping; leaves petiolate, cordate, ovate, 5-nerved, somewhat undulate or crenate, smoothish; flowers disposed in rather second spikes; limb of calyx broadly and bluntly 5-lobed. 2. S. Native of Brazil. Triblémma nymphaefólia, Mart. herb. This is very distinct from the first species, the leaves having very much an inch long. Flowers small and purple.

Ovate-leaved Bertolonia. Pl. creeping.

3 B. Leuzeana (D. C. l. c.) stems suffruticos, short, simple, tetragonal, ascending, rather creeping; leaves petiolate, oval-oblong, acute, sharply denticulate, 5-nerved, smoothish; petals corymbs terminal; limb of 5 obtuse lobes, equal in length to the tube; petals obliquely acuminate. 2. S. Native about the town of Rio Janeiro. Flowers lilac. Rhédia Leuzeana, Bonpl. rhex. p. 144. t. 54. and t. 55.

De Leuze's Bertolonia. Pl. 6 feet.

4 B. maculata (D. C. l. c.) stem rooting at the base; branches, petioles, peduncles, and calyces hispid from long bristles; leaves on long petioles, cordate, ovate, quite entire, pilose on both surfaces and on the margins, 5-nerved; peduncles axillary, bearing at the apex a short raceme of 6-7 flowers. 2. S. Native of Brazil, in the province of Bahia on the mountains, in shady humid places of woods. Triblémma maculata, Mart. herb. Racemes twisted at the apex. Lobes of calyx 5, ovate, and very blunt. Petals violaceous. Anthers truncate, opening by 1 pore, attenuated at the base but not auricled, 5 of which are smaller than the others. Calyx permanent, at length white from small bristles on the outside at the base. Capsule 3-valved. Seeds small, trigonal, cuneate, scabrous.

Spotted Bertolonia. Pl. creeping.

Cult. Bertolonia is a genus of elegant little creeping plants; its species grow best in a mixture of peat and sand. The pots in which they are grown should be kept in pans of water, especially in the summer, when the plants are in full vigour. They are easily increased by dividing the plants, or by seeds.

XVI. MEISNERIA (dedicated to C. F. Meisner, author of a monograph on the difficult genus Polýgonum, &c. D. C. prod. 3. p. 114.)

Lin. syst. Octádria, Monogónia. Tube of calyx globose; lobes 3, lanceolate, acuminate. Anthers 8, ovate, ending in a tubular beak each; 4 of which have a very long connective each, which is auricled at the articulation, in the other 4 the connective is hardly evident. Capsule 2-celled. Seeds small, ovate, triquetrous.—Herbs hardly shrubby, probably annual. Stems erect, terete, rather hairy. Leaves ovate, acute, sessile, 3-nerved, somewhat ciliately serrated. Flowers pedicellate, solitary, alternate in the axils of the branches and of the leaves, and truly cymose at the apex, small, purple. This genus differs from Spénnera in the seeds not being coelate.

1 M. arenári'a (D. C. prod. 3. p. 114.) almost herbaceous; stem and branches almost terete, hispid; leaves hairy. 0. F. Native of Brazil, in the province of Minas Geraes, at Serro Frio in sandy sub-irrigated places. Rhédia arenári'a, Schrank et Mart. mss. Hairs on the stems, panicles, and calyces glandular at the apex, usually pale purple in a young state. Petals apicalculated. Capsule subglobose.

Sand Meisneria. Pl. 1 foot.

2 M. paludósa (D. C. l. c.) almost herbaceous; stem and branches tetragonal, rather pilose; leaves smoothish on both surfaces. 0. F. Native of Brazil, in the province of Minas Geraes, in marshes on the mountains. Rhédia bilocularis, Schrank et Mart. mss. Very like the preceding species, but the hairs are much fewer, shorter, and never red; the stem is evidently tetragonal, and the hairs are sometimes scattered and sometimes disposed in rows along the branches. Petals purple.

Marsh Meisneria. Pl. ½ to 1 foot.

Cult. See the annual species of Salpinga, p. 740, for culture and propagation. The plants should be kept moist by placing the pots in which they are grown in pans filled with water.

Tribe II.

RHEXIEäE (plants agreeing with the genus Rhédia in the seeds being coelate). D. C. prod. 3. p. 114. Anthers opening by 1 pore at the apex. Ovarium free, neither scaly nor bristly at the apex. Capsule dry. Seeds coelate, with a basal orbicular hytum.—Species all natives of America, except one.

Lin. syst. Octádria, Monogónia. Tube of calyx ovate and rather urceolate; limb campanulate, broadly and bluntly 4-toothed. Petals 4, obovate. Stamens 8, equal: having the connexes filiform and drawn out both beneath and above the cells of the anthers into 2 bristles at the articulation. Capsule oblong, 3-celled, 3-valved; central column at length free, and bearing the seeds. Seeds coelate. An annual, erect, glandular herb, native of Guiana. Root fibrous. Leaves petiolate, ovate, 5-nerved, ciliately serrated, Cymes terminal, few-flowered. Flowers small, white. This genus comes very near Salpinga, but differs in the anthers.

1 A. thymifólia (D. C. l. c.). 0. S. Native of Cayenne. Rhédia thymifólia, Bonpl. rhex. p. 153. t. 50. Nerves of calyx 8, elevated.

Thyme-leaved Appendiculária. Pl. 1 to 1½ foot.

Cult. See annual species of Salpinga for culture and propagation, p. 740.

1 C. berberifólia (D. C. l. c.). 0. S. Native of Brazil. Rhédia berberifólia, H. B. et Bonpl. rhex. p. 110. t. 49. Petals rather acuminate, longer than the genitals. Style filiform. Ovarium glabrous. Glands few along the lobes of the calyx and at their origin. Calyx 8-nerved. Connectives of anthers drawn out at both sides at base.

Barberry-leaved Comolia. Shrub 2 to 3 feet.

Cult. For culture and propagation see Meriânia, p. 733.

Lin. syst. Octo-Deccándria, Monogónia. Tube of calyx globose; lobes 4-5, short. Flower-bud conical. Petals lanceolate, acute. Stamens 8-10; anthers ovate, obtuse, opening by 1 pore; having their connexes long, but not appendiculated. Capsule free, 2, rarely 3-celled. Seeds coelate, rough.—American erect herbs. Roots fibrous. Leaves petiolate, 5-
nerved, membranous, ciliately serrated. Peduncle terminal, loose, with the branches divaricate. Bracteas small, linear, inserted under the branches. Flowers small, white, or rose-coloured.

*Flowers octandrous. Leaves not cordate at the base.*

1. **S. faludosa** (Mart. herb. ex D. C. I. c.) stems rooting at the base, angular, clothed with rufous hairs, the hairs disposed in a bifarious manner; leaves on short petioles, ovate, acute, ciliately serrated, 3-5-nerved, sparingly pilose; cymes somewhat panicled, short. C. S. Native of Brazil, about Rio Janeiro, in humid sandy places. Rhéxia hexádria, Schrank. mss. Calyx 3-cleft. Stamens 8. Fruit small, globosely, puberulous. Marsh Spennera. Pl. ½ to 1 foot.

2. **S. annua** (Mart. herb. ex D. C. I. c.) stem tetragonal; angles rather winged; petioles and leaves sparingly pilose; leaves on short petioles, broadly ovate, acute, 5-nerved, ciliately serrated; panicle oblong; fruit glabrous. C. S. Native of Brazil, in the province of Bahia, in watery places. Melástoma annua, Schrank. mss. Very like the preceding species, but smaller in every part, and the petioles are shorter. Leaves 15 lines long and 9-10 broad. Annual Spennera. Pl. ¾ to 1 foot.

3. **S. brachybotrya** (D. C. I. c.) stem creeping at the base, ascending, erect, angular, rather pilose; angles a little winged; leaves on short petioles, ovate, acute, 5-nerved, rather pilose, hardly serrulated; panicle short; fruit glabrous. C. S. Native of Brazil, in marshes. Very like *S. annua*, but the leaves are on shorter petioles, and the panicle is shorter and more crowded. Short-bunched Spennera. Pl. ½ to 1 foot.

4. **S. laúxa** (D. C. I. c.) stem hardly rooting at the base, ascending, erect, angular, pilose; petioles pilose, elongated; leaves ovate, bluntish at both ends, 5-nerved, ciliately serrated, rather pilose beneath; panicle corymbose; fruit glabrous. C. S. Native of Brazil, in marshes. Petioles 8 lines long. Leaves 3 inches long and 1½ broad. Broad-leaved Spennera. Pl. ½ to 1 foot.

7. **S. longifólia** (Mart. herb. ex D. C. I. c.) stems terete; branches, petioles, and nerves of leaves sparingly pilose; leaves on long petioles, oblong, acuminated, 5-nerved, ciliately serrated. C. S. Native of Para, in Brazil. Very like *S. rubricáulis* and *S. acuminífolia*. Long-leaved Spennera. Pl. ½ to 1 foot.

8. **S. rubricáulis** (Mart. herb. ex D. C. I. c.) stems terete, and are as well as the petioles and leaves beset with spreading hairs; leaves petiolate, oval-ovate, long-acuminated, 5-nerved, ciliately serrated; panicle elongated. C. S. Native of Brazil, in the province of Bahia, in woods at the river Eahype. Melástoma rubricáulis, Schrank, mss. Petioles hispid. Stems purplish. Petals white. Anthers red. Red-stemmed Spennera. Pl. ¼ to 1 foot.

9. **S. acuminífolia** (Mart. herb. ex D. C. I. c.) smoothish; stem terete, and is as well as the leaves sparingly pilose; leaves oval-oblong, acuminated, 5-nerved, ciliately serrated; panicles loose, in the forks of the branches. C. S. Native of Brazil. Very like *S. rubricáulis* and *S. annua*, but differs from both in the smoothness and narrowness of the leaves. Acuminífola-leaved Spennera. Pl. ¾ to 1 foot.

10. **S. circéfolia** (Mart. et Schrank. mss. ex D. C. I. c.) branches quadrangular; hairs scattered, capitulate at the apex; leaves petiolate, ovate, acuminated, ciliately serrated, 5-nerved, membranous, glabrous on both surfaces, shining above; thyrse oblong, with its branches opposite; tube of calyx rather urceolate, with short, subulate lobes. B.? S. Native of Brazil, about Ega, at the river Amazon. Flowers small, white. Petals oblong. Four of the anthers are oblong-obovate, and the other 4 shorter, all very blunt; with the connectives hardly drawn out. Leaves like those of *Círcæa*. Fruit unknown. Circéa-like Spennera. Sh. ¾ to 3/4 foot.

*Flowers octandrous. Leaves cordate at the base.*

15. **S. indecora** (D. C. I. c.) stem branched; branches quadrangular, hairy; leaves cordate, acuminated, serrulated, ciliated, pilose on both surfaces; branches of panicle dichotomous, hairy; flowers pedicellate; calyx clothed with glandular pili, with 4 short teeth. B.? S. Native of Brazil. Rhéxia indecora, Bonpl. rhex. p. 131. t. 49. Flowers small, white. Leaves like those of *Círcæa luteátila*. Petals ovate, obliquely mucronate. Capsule unknown. Indecorous Spennera. Pl. 1 to 2 feet.

16. **S. silenifólia** (D. C. I. c.) stem branched; branches quadrangular, glabrous; leaves obsolescently cordate, oblong, acu-
minated, serrulatcd, ciliated, 5-nerved; flowers sessile, along the branches of the dichotomous panicle; calyx with an inflated, glabrous tube, and 4 hardly manifest lobes. \( \frac{1}{2} \). S. Native of Brazil. Rhexia sileniflora, Bonpl. rhex. p. 130. t. 48. Flowers small, white. Petals ovate, obliquely mucronate. Capsule unknown. This and the preceding species have been placed in this genus from their habit, the capsules being unknown.

**Catchfly-flowered** Spennera. Pl. 1 to 2 feet.

**\* \* Flowers decandrous.**

**Pendulous-leaved** Spennera. Pl. \( \frac{1}{2} \) to 1 foot.

18 S. glandulíflósa (D. C. l. c.) leaves ovate, crenulated, quite glabrous on both surfaces, 3-5-nerved: flowers usually solitary, terminal, and axillary, small; capsule 3-celled. \( \frac{1}{2} \). S. Native of Guiana. Rhéxiá glandulíflósa, Bonpl. nav. p. 70. t. 27. Calyx with a subglobos tube and linear-oblong lobes, which are much longer than the tube. Petals ovate, white, with 2 spots at the base of each. Filaments red. Connectives of anthers biglandular.

**Glandular-stamed** Spennera. Shrub \( \frac{1}{2} \) to 1 foot.

19 S. \( \text{cist.'} \) todon (D. C. l. c.) shrubby, smooth; petioles ciliated with long hairs in front; leaves oblong, acuminate, membranous, somewhat serrulated, glabrous, triple-nerved; panicles axillary, divaricate, capillary; calyx pilose, urceolate, narrowed at the neck: having its lobes setaceous; capsule 3-4-celled. \( \frac{1}{2} \). S. Native of Brazil, in dense woods, in the province of Rio Negro. Melástoma cha'etodon, Schrank et Mart. mss. Flowers small. Leaves 4-6 inches long.

**Hair-toothed-calyxled** Spennera. Shrub \( \frac{1}{2} \) to 1 foot.

**Cult.** Pretty little plants, native of marshes and bogs. The species grows best in a mixture of peat and sand, and the pots in which they are grown should be kept in pans of water. The greater part are annuals, and even those called shrubby will not survive more than a season in our stoves; therefore they are all to be increased by seeds. The seeds should be sown in pots filled with the same kind of mould recommended for the plants, placing them in a hot-bed, where they should be kept rather moist; and when the plants are coming into flower they should be removed from the hot-bed to shelves in the stove.

XX. MICROLICIA (from μπος, μικρός, small, and ἔλλικα, elíkia, stature; all the plants contained in this genus are humble in stature). D. Don, in wear. soc. mem. 4. p. 301. D. C. prod. 3. p. 117.

**Lin. syst.** Decántria, Monogónia. Calyx with a globose or obovate tube, and 5 subulate permanent lobes. Petals 2 or 5, obovate. Anthers alternately dissimilar, ovate, ending in short beaks, opening by 1 pore; having their connectives drawn out into a simple blunt spur at the articulation, those in the longer anthers long, and those in the shorter anthers short. Capsule dry, 3-celled, 3-ribbed, but in a few 2-celled and 2-ribbed. Seeds coelacitic.—Herbs or subshrubs, natives of Brazil and Guiana, in marshes and bogs, and all humid places. Stems branched. Leaves sessile, quite entire, linear or oval, hardly 3-nerved. Flowers purple, terminal or axillary, pedicellate, usually solitary.

**\* Annual plants.**

**Short-leaved** Microlicia. Pl. 1 to 2 feet.

2 M. trívílís (D. C. l. c.) glabrous; stem straight, tetragonal, hardly branched at the apex; leaves ovate, obtuse, 3-nerved, quite entire; flowers terminal, solitary, on short pedicels; lobes of calyx subulate, longer than the tube; capsule 2-valved. \( \circ \). B. S. Native of Guiana, in marshes. Melástoma trívílís, Aubl. guian. 1. p. 406. t. 155. f. a. Rhéxiá trívílís, Vahl. eclog. 1. p. 38. Corolla white.

**Two-valved** Microlicia. Pl. \( \frac{1}{2} \) foot.

3 M. inunda'ta (D. C. l. c.) erect; stems tetragonal, glabrous at the base, but beset with glandular hairs above, as well as the pedicels and calyces; leaves ovate, obtuse, 3-nerved, entire, glabrous, upper ones clothed with glandular down; flowers solitary, pedicellate; tube of calyx ovate, rather shorter than the lobes, which are linear-lanceolate. \( \circ \). B. S. Native of Brazil, in watery places. Rhéxiá inunda'ta, Schrank et Mart. mss. Capsule 2-valved. Seeds coelacitic. Perhaps sufficiently distinct from M. biélítis.

**Inundated** Microlicia. Pl. \( \frac{1}{2} \) foot.

**\* Herbaceous, perennial, or suffruticosæ plants.**

4 M. limnosóbas (D. C. l. c.) herbaceous, rooting at the base, hairy from glandular bristles; leaves roundish, sessile, rather coriaceous at the base, quite entire, smooth; flowers pedicellate; calyx with an obovate tube, and 5 linear lobes; capsule 2 or 3-celled. \( \frac{1}{2} \). B. S. Native of Brazil, in water. Rhéxiá limnosóbas, Schrank et Mart. mss. Flowers red.

**Lake-living** Microlicia. Pl. \( \frac{1}{2} \) foot.

5 M. al'ísinevfólia (D. C. l. c.) herbaceous, ascending, a little branched; stems tetragonal, hispid; leaves on short petioles, rather orbicular, somewhat coriaceous at the base, acutish at the apex, 5-nerved, almost quite entire, ciliated, rather pilose on both surfaces, appearing pitted from dots on the upper surface when examined by a lens; flowers solitary, terminal, terminating the branchlets; calyx rather hairy, with an ovate tube, and 5 linear lobes, which are longer than the tube; anthers reutise, dissimilar. \( \frac{1}{2} \). B. S. Native of Brazil, in elevated places in the province of Minas Geraes. Rhéxiá al'ísinevfólia, Mart. et Schrank, mss. Petals obvate, purplish. Anthers 10, the 5 longest having long connectives, and the 5 shortest having short connectives, all 2-lobed at the articulation.

**Chickweed-leaved** Microlicia. Pl. \( \frac{1}{2} \) foot.

6 M. punctatíssima (D. C. prod. 5. p. 118.) plant somewhat herbaceous, much branched, hispid from glandular pili in every part; branches tetragonal; leaves petiolate, ovate, acute, ciliately sub serrated, 3-nerved, appearing pitted from dots on the upper surface when examined by a lens; flowers solitary, axillary, and terminal, on short pedicels; calyx with a globose tube, equal in length to the linear lobes; anthers dissimilar. \( \frac{1}{2} \). B. S. Native of Brazil, in moist meadows in the province of Minas Geraes. Rhéxiá punctatíssima, Mart. et Schrank, mss. Allied to M. al'ísinevfólia. Capsule ovate, 3-celled, 3-valved. Seeds obvate, truncate at one end.

**Var. B. angustíflólia (D. C. l. c.) leaves oblong, almost quite entire.**

**Much-dotted-leaved** Microlicia. Pl. \( \frac{1}{2} \) foot.

7 M. recúivá (D. C. l. c.) plant herbaceous, branched, beset with glandular pili in every part; stems and branches tetragonal; leaves petiolate, ovate, somewhat crenated, deflexed, acutish, 3-

Reeved Microlicia. Pl. 1 foot.

8 M. variabilis (Mart. ex D. C. L. c.) suffruticose, erect; branches tetragonal, beset with glandular pilif; leaves almost sessile, broadly ovate, acute, ciliate serrated, pilose on both surfaces, 3-nerved; flowers pedicellate, axillary and terminal, solitary; calyx rather hairy, with a glbose tube, and linear subulate lobes, which are about equal in length to the tube; anthers dissimilar. 7. B. S. Native of Brazil, in alpine meadows in the provinces of St. Paul and Minas Geraes. Anthers as in M. alsinefolia. Flowers rose-coloured.

Var. β, radicans (Schrant et Mart. mss. ex D. C. L. c.) plant herbaceous, erect, rooting at the base, and less pilose than the species. 7. B. S. Native of marshes, especially at Serro Frio.

Var. γ, herbacea (Schrant et Mart. mss. ex D. C. L. c.) plant herbaceous, ascending, rooting at the base, smoothish in every part; flowers axillary, almost sessile. 2. B. S. Native of the province of St. Paul, in bogs. Rhéxia cordata, Sprrg. neue endt. 1. p. 301. Rhéxia variabilis, Mart. et Schrant, mss. Very like variety β, and truly deciduous. Perhaps a proper species. Flowers bluish red.

Variable Microlicia. Pl. 1 foot.

9 M. lanceolifera (D. C. prod. 3. p. 118.) suffruticose, much branched, erect, hispid from glandular pilif in every part; leaves on short petioles, ovate, ciliate serrated, 3-nerved; pedicels axillary, 3-flowered, disposed in an elongated thyrse; tube of calyx cylindrical, a little longer than the lobes, which are 5 and linear; petals oblong; anthers elongated, with their connectives hardly drawn out. 7. B. S. Native of Brazil, in inundated parts of meadows, particularly in the province of St. Paul. Rhéxia lanceolata, Mart. et Schrant, mss. Plant almost like that of M. variabilis, but the flowers are much more numerous, and the calyces tubular; the petals 3 times the length of their breadth. Flower-bud lanceolate. Longer anthers rather unequal among themselves, with their connectives long, but hardly drawn out at the articulation.

Lance-flowered Microlicia. Shrub ½ to 1 foot.

10 M. violacea (D. C. prod. 3. p. 118.) suffruticose, hispid from glandular hairs; leaves sessile, broadly ovate, quite entire, 5-nerved, full of pitted dots on the upper surface when examined by a lens; flowers axillary, solitary, almost sessile; tube of calyx glbose, about equal in length to the oblong-linear lobes; petals oblong; anthers elongated, dissimilar. 7. S. Native of Brazil, on the high mountains in the province of Minas Geraes. Rhéxia violacea, and perhaps also Rhéxia viscidula, Schrant et Mart. mss. The leaves resemble those of M. alsinefolii and M. punctatissima; anthers and petals those of M. lanceolata. The five longer anthers have long connectives, which are drawn out into a small blunt 2-lobed appendage each; the five shorter ones have short connectives, which are hardly drawn out at the base.

Violaceous-flowered Microlicia. Shrub ½ to 1 foot.

11 M. serrulatifolia (D. Don, in mem. wern. soc. 4. p. 301.) shrubby; leaves elliptic, acute, spreading, downy on both surfaces, as well as the branches; flowers solitary, pedicellate; calyces pubescent. 7. S. Native of Brazil. Stem erect, much branched. Branches tetragonal. Leaves obsolescent 3-nerved, about the size of those of wild-thyme. Flowers purple.

Wild-thyme-leaved Microlicia. Sh. ½ foot.

12 M. graveolens (D. C. prod. 3. p. 119.) suffruticose, diffusely branched; branches somewhat tetragonal, beset with glandular hairs; leaves sessile, ovate, acute, 3-nerved, obsolescent, full of setose dots on both surfaces; flowers axillary, sessile, solitary, crowded at the tops of the branches; tube of calyx 10-ribbed, beset with glandular bristles, longer than the lobes, which are 5, lanceolate and acute; anthers dissimilar. 7. B. S. Native of Brazil, in the province of Minas Geraes, on the mountains and in irrigated parts of meadows. Rhéxia graveolens, Mart. et Schrant, mss. Leaves 2 lines long. Petals violaceous. Anthers 10, ovate, with short blunt beaks: having the connectives of 5 drawn out into a dilated somewhat 2-lobed appendage each, those of the other 5 short. Capsule ovate-conical, 3-celled, 3-valved. Seeds somewhat coileulate. Plant with a heavy scent.

Strong-scented Microlicia. Sh. ½ to 1 foot.

13 M. marifolia (D. Don. mem. wern. soc. 4. p. 301.) shrubby; leaves decussate, ovate, bluntish, 3-nerved, on short petioles, downy on both surfaces, as well as the branches; flowers axillary, solitary, pedicellate. 7. S. Native of Brazil. An erect, much branched, leafy shrub, with tetragonal branches and obsolescent crenulate leaves. Calyx downy.

Cut-thyme-leaved Microlicia. Sh. ½ foot.

14 M. jungernannoides (D. C. L. c.) shrubby; branches hispid; leaves sessile, ovate, ciliate serrated, 5-nerved, smoothish above, but bristly beneath; flowers usually solitary, axillary, and terminal; calyx setigerous, with the tube glbose, and the lobes linear-subulate, about equal in length to the tube; anthers dissimilar. 7. S. Native of Brazil, in the province of Minas Geraes, on the Diamond Mountains. Rhéxia jungernannoides, Mart. et Schrant. mss. The bristles on the upper part of the plant are glandular. Leaves like those of Bécula niusa. Petals violaceous. Anthers 10, ovate-oblong, ovoid each in a short cuneulate beak: 5 of which have their connectives longer than the anthers; those of the other 5 short. Capsule ovate-globose, 3-valved.

Jungernannoid-like Microlicia. Sh. ½ to 1 foot.

15 M. subsectosa (D. C. L. c.) stem shrubby; branches terete, bristly; leaves sessile, oblong-ovate, acute, quite entire, finely 3-nerved, full of glandular dots on both surfaces, and with a few bristles on the margins and nerves; flowers terminal, solitary, sessile, deciduous: calyx full of glandular dots, having 3 oblong rather bristly lobes. 7. S. Native of Brazil, on the mountains. Rhéxia sectosa, Schrant et Mart. mss. but not of Spreng. Leaves 2-3 lines long. Petals purple. Anthers yellow, beaked: having their connectives drawn out at the articulation into a blunt appendage each, 3-times the length of the anthers. From habit this species is allied to M. variolosa.

Subsectose Microlicia. Sh. ½ to 1 foot.

16 M. seringeana (D. C. L. c.) shrubby, hispid from yellowish hairs; branches tetragonal; leaves sessile, ovate, serrate, approximate, somewhat 3-nerved, full of glandular and pellucid dots, hairy; flowers solitary, sessile, terminal; calyx hairy, with a turbinate 10-ribbed tube, and 5 triangular lobes; anthers dissimilar. 7. S. Native of Brazil. Rhéxia Seringeana, Mart. herb. Petals purple, ciliated when young. Anthers 10, oval, bluntly beaked, 5 with long connectives, which are appended at the base. Capsule 3-celled, permanent. Allied to M. variolosa, but distinct.

Seringe’s Microlicia. Sh. ½ to 1 foot.

17 M. vestita (D. C. L. c.) shrubby, branched; branchlets filiform, rather hairy from small pilif; leaves sessile, somewhat imbricated in four rows, ovate, acute, quite entire, somewhat 3-nerved, smoothish above, beset with long adpressed bristles or
villi beneath, and on the margins; flowers solitary, on short pedicels in the axils of the upper leaves; calyx bristly, with an ureolate tube and a 5-toothed limb; anthers dissimilar. p. S. Native of Brazil, in the province of Bahia, on the mountains. Rhéxia vestita, Schrank et Mart. mss. Petals purplish. Leaves 2 lines long. Anthers ovate, terminating in short beaks; with the connectives appendiculate, the appendices in 4 filiform, and in the other 4 they are dilated and blunt.

Clothed Microlicia. Sh. ½ to 1 foot.

18 M. variolosa (D. C. prod. 3. p. 119.) shrubby, branched, erect; branches tetragonal; leaves sessile, ovate, oval or oblong, quite entire, somewhat 3-nerved, full of glandular dots on both surfaces; flowers solitary, axillary or subterminal, on short pedicels; calyx turbinate, with 5 triangularly oblong lobes, which are hardly shorter than the tube; anthers dissimilar. p. S. Native of Brazil and Peru. Leaves 2-4 lines long, and ½ to 3 broad. Capsule ovate, 3-celled, 3-valved. Seeds oblong, kidney-shaped, dotted when examined with a lens.

Var. a, hirsuta (D. C. l. c.) branches and leaves villous on both surfaces, or velvety. The Rhëxia fasicellulata, virgulata, thymifólia, baccharoidei, ephorbioides, ephorbioides, hisrûta, venasica, and cénerva of Schrank and Mart. mss. are probably only variations of the same.

Var. b, glabra (D. C. l. c.) branches rather hispid; leaves glabrous. The Rhëxia eelachistophylla, Cochobambé, alteréns, and variolosa of Schrank et Mart. mss. are probably variations of this plant.

Variolose Microlicia. Sh. ½ to 1 foot.

20 M. linophylla (D. Don, l. c.) shrubby, much branched, glabrous; leaves lanceolate, awned, flat, quite entire, 3-nerved, glabrous; flowers solitary, nearly sessile, terminal or axillary. p. S. Native of Brazil. Shrub erect, twiggy, with tetragonal branches. Leaves spreading. Calyx glabrous.

Plax-leaved Microlicia. Sh. ½ to 1 foot.

21 M. scoparia (D. C. l. c.) suffruticoso, much branched, quite glabrous; branches fastigate, tetragonal, erect; leaves sessile, linear-subulate, quite entire, rather fleshy, nerveless, channelled above; flowers solitary, terminal, on short pedicels; calyx with a cylindrically turbinate tube: and 5 linear-subulate lobes, which are about equal in length to the tube; anthers dissimilar. p. S. Native of Brazil, in the province of Minas Geraes in sandy fields on the tops of the highest mountains. Rhëxia scoparia, Aug. St. Hil. in Bonpl. iux. p. 152. t. 59. Leaves 2-3 lines long. Petals purple. Anthers 10, oblong, the 5 smaller ones ending in a short cylindrical appendage each, and having their connectives drawn out into an arched thread. Ovum 3-celled, many-seeded.

Brown Microlicia. Sh. 1 to 2 feet.

22 M. isophylla (D. C. l. c.) fruticulose, much branched, glabrous; branches fastigate, filiform, tetragonal; leaves sessile, oblong-subulate, quite entire, 1-nerved, full of pitted dots; flowers solitary, terminal; tube of calyx turbinate; lobes subulate, longer than the tube. p. S. Native of Brazil, in the province of Minas Geraes, in the high sandy pastures on the mountains. Rhëxia isophylla, and R. uncata, Schrank and Mart. mss. Very like M. scoparia. Capsule 3-4-celled. Anthers dissimilar, ovate, beaked: in the longer ones the connective is drawn out into a long, cuneiform, rather emarginate appendage, but in the others it is short and blunt at the articulation.

Equal-leaved Microlicia. Sh. 1 foot.

23 M. aristata (D. C. prod. 3. addend. p. 484.) fruticulose, much branched, glabrous; branches tetragonal; leaves linear, quite entire, slightly 3-nerved, full of dots on both surfaces, ending in an awn, like the calyce: lobes; flowers axillary, solitary, and terminal twin, almost sessile; calyx oblong, 10-ribbed. p. S. Native of Brazil, in the province of Minas Geraes on the mountains, particularly on Serrro Frio. The habit of the plant is almost that of Líthrum or Sitarëra. Anthers ovate-oblong, terminated by a tubular base each; the connectives of the 5 longer ones long, and calarate at the base. Capsule 3-celled. Seeds coelestle, permanent around the axis.

Awned-calyx Microlicia. Pl. ½ to 1 foot.

24 M. ereicoides (D. Don, l. c. p. 592.) shrubby; leaves linear, mucronate, flat, loose; flowers twin; calyx glabrous. p. S. Native of Brazil. Stems numerous, ascending, tetragonal, almost simple, tuféd, rising from a thick root. Rhëxia ereicoides, Spreng. is distinct from this plant, and is probably referrible to the genus Chactóstoma.

Heath-like Microlicia. Sh. ½ to 1 foot.

25 M. cupreusina (D. Don, l. c.) shrubby; leaves lanceolate, pungent, numerous, imbricate, marginate; flowers solitary; calyx hispid. p. S. Native of Brazil. Stem erect, much branched; branches terete, slender, proliferous, full of leaves at the apex, but naked below.

Cypress-like Microlicia. Sh. ½ to 1 foot.

26 M. trichocalycina (D. C. l. c.) shrubby, much branched, smoothish; branches tetragonal; leaves sessile, oblong-linear, acute, almost quite entire, usually 3-nerved, glabrous, full of glandular dots beneath; floral and calyce leaves bearing long distant stiff hairs; calyx subglobose, with 5 subulate lobes; anthers dissimilar. p. S. Native of Brazil, in the province of Minas Geraes, on Mount Grao-mayor, at the height of 4000 feet. Rhëxia trichocalycina, Mart. et Schrank, mss. Leaves longer and more spreading than those of M. scoparia, to which the present plant is nearly allied. Petals purple. Anthers 10, ovate, with short beaks: 5 of which have their connectives appendiculate. Capsule 3-celled. Seeds oblong, rather incurved, dotted when examined by a lens.

Hair-calyx Microlicia. Sh. 1 foot.

27 M. arenariafolia (D. C. l. c.) suffruticose, much branched, quite glabrous; branches slender, terete; leaves sessile, linear, acuminate, quite entire, almost veinless; flowers on short pedicels, axillary, solitary; lobes of calyx 5, linear-subulate, longer than the tube; capsule 3-valved. p. S. Native of Peru, at Cochobambé. Rhëxia arenariafolia, Mart. et Schrank, mss. Flower-bud oblong, acute. Stamens unknown. Flowers unknown.

Sandal-wort-leaved Microlicia. Sh. ½ to 3 foot.

28 M. setosa (D. C. l. c.) fruticulose; branches glabrous, fuscos, knotted; leaves almost sessile, full of dots, quite glabrous, linear-oblong, obliquely 3-nerved, bristly; peduncles very short, axillary, and terminal; calyx campanulate, with 5 linear spreading teeth, each terminating in a bristle. p. S. Native of Brazil. Rhëxia setosa, Spreng. neae. entl. 1. p. 304.

Bristly Microlicia. Sh. ½ to 1 foot.

Cult. All the species are dwarf plants, growing in inundated places of meadows. Some of them, therefore, require to be grown as subaquatic plants, that is, in pans filled with a mixture of peat and sand in the bottom, and filled up with water, but the water should not rise higher than an inch or an inch and a half above the soil; others require to be grown in pots, placed in pans of water. The species are increased by seeds or dividing.
XXI. ERNESTIA (in honour of Ernest Meyer, author of the primitive Florae Essequiboensis, Gottenburg. 4to. 1818.) D. C. prod. 3. p. 121.

Lin. syst. Octandria, Monogynia. Calyx with a globose tube, and 4 narrow acuminate lobes. Petals 4, obvolute, ciliated. Anthers triquetrous, drawn out at the base into 2 long bristles each. Capsule 4-celled. Seeds unknown.—Herb, with the habit of Spennemia, but differs in the form of the anthers, which are anomalous in this genus, and in the capsule being 4-celled.

Slender Ernestia. Pl. \( \frac{1}{2} \) to 1 foot.

Cult. For culture and propagation see Spennemia, p. 743.

XXII. SIPHANTHERA (from σφάον, siphan, a tube, and \( \omega \_ \varepsilon \_ \rho \_ \nu \_ \alpha \_ \theta \_ \alpha \_ \) anther, an anther; in reference to the anthers, which terminate in a long tubular beak). Pohl. pl. bras. 1. p. 102. D. C. prod. 3. p. 121.

Lin. syst. Tetrandria, Monogynia. Calyx campanulate, 4-toothed, girded by many bracteas; bracteas permanent. Petals 4, orbicular. Stamens 4, exerted; anthers oblong, furnished with an obovate ascending process at the base, and a tubular beak at the apex. Ovarium adnate to the calyx at the base. Style filiform. Capsule depressed, 2-celled, 2-valved, obcordate at the apex. Seeds numerous, oblong-ovate or ovate, rather convex on one side, reticulated.—Small elegant annual herbs, clothed with glandular hairs. Leaves opposite, sessile, toothed, feather-nerved. Flowers crowded into axillary and terminal heads; with rose-coloured or white petals, and blue anthers.

1 S. cordata (Pohl. pl. bras. 1. p. 183. t. 84.) leaves broad, cordate, upper ones narrower, serrated, villous; fascicles many-flowered, on short peduncles; bracteas ovate, toothed, inner ones narrow; beak of anthers long and attenuated. S. Native of Brazil, in the province of Goyaz, in boggy meadows on the tops of the mountains. Rhexia veronicacefolia, Mart. herb. Stem reddish. Branches somewhat tetragonal. Petals rose-coloured.

Cordate-leaved Siphanthera. Pl. \( \frac{1}{2} \) to 1 foot.

2 S. tenella (Pohl. pl. bras. 1. p. 104. t. 85. a.) leaves roundish-ovate, unequally toothed; fascicles of flowers on long peduncles; bracteas ovate, acute, terminated by a long hair each; beaks of anthers very short. S. Native of Brazil, on the tops of mountains in the province of Goyaz. Branches tetragonal. Petals white, spotted with red at the base.

Tender Siphanthera. Pl. \( \frac{1}{2} \) foot.

3 S. sulcitata (Pohl. L. c. p. 105. t. 85. f. b.) leaves oblong-ovate, acutish, unequally dentilicate; fascicles of flowers on long peduncles; bracteas oblong, denticulate, terminated by a long hair each; beaks of anthers rather elongated. S. Native of Brazil, in the province of Goyaz, on sandy parts of mountains, particularly between Corimba and Rio St. Marcos. Branches tetragonal. Corolla white.

Subtile Siphanthera. Pl. \( \frac{1}{2} \) foot.

Cult. All the species are elegant little annual plants. Their culture and propagation are the same as that for Spennemia, p. 715.

1 R. martiana (Lin. spec. 491.) stem terete, hairy; leaves on short petioles, lanceolate, acute at both ends 3-nerved; calyx smoothish. S. H. Native of North America, in sandy woods from New Jersey to Carolina; also in Maryland, and probably in Louisiana, if R. Ludoviciana, Rafin. fl. lud. p. 92. be the same. Loddd. bot. cab. t. 366.—Phuk. alim. t. 428. f. 1. Lam. ill. t. 283. f. 1.

Var. a, purpurea; leaves narrow-lanceolate or oblong; flowers deep purple. Michx. fl. bor. amer. 1. p. 221.

Var. b, rubella; leaves oval-oblong; flowers pale red. Michx. 1. c. Sweet, fl. gard. t. 41.

Maryland Rhexia. Fl. June, Aug. Clt. 1759. Pl. \( \frac{1}{2} \) to 1 foot.

2 R. virgirina (Lin. spec. p. 491.) stem tetragonal, smoothish; angles winged; leaves sessile, oval-lanceolate, ciliate serrated, 3-nerved, rather hispid, as well as the calyces. S. H. Native of North America, from New York to Carolina, in bogs and woods in humid places. Lam. ill. t. 283. f. 2. Sims, bot. mag. t. 965. Flowers small, purple.

Virginian Rhexia. Fl. June, Aug. Clt. 1759. Pl. \( \frac{1}{2} \) foot.

Ciliated Rhexia. Fl. June, Aug. Clt. 1812. Pl. \( \frac{1}{2} \) to 1 1/2 foot.

4 R. serrulata (Nutt. gen. amer. 1. p. 243.) stem quadrangular, smooth; leaves on short petioles, roundish-ovate, smooth on both surfaces, rather ciliated at the base, and with the margins serrated; flowers pedunculate, ciliated; calyx beset with glandular hairs; the lobes acute. S. H. Native of Georgia and Florida, in open marshes. Very like R. citisosa. Flowers purple, subcorymbose.

Serrulate-leaved Rhexia. Pl. \( \frac{1}{2} \) foot.

5 R. glabrella (Michx. fl. bor. amer. 1. p. 222.) stems terete, smooth; leaves sessile, erect, lanceolate, smooth, finely denticulate or entire (ex Nutt.); flowers subcorymbose; calyx beset with glandular hairs. S. H. Native of Carolina and Georgia, in sandy humid woods. Bonpl. rhex. t. 44. Flowers large, pale purple. Root tuberous.

Smooth Rhexia. Pl. 4 feet.

6 R. stricta (Pursh, fl. amer. sept. 1. p. 258.) stem straight, tetragonal, glabrous, but bearded at the joints; angles winged;
leaves sessile, erect, narrow-lanceolate, tapering into an acumen at the apex. 3-nerved, glabrous on both surfaces; corymb dichotomous; calyces smoothish. 2. H. Native of Georgia and South Carolina, in humid places. Flowers purple. Very like the variety of *R. glabellata* according to Nutt. gen. amer. 

**Straight* Rhegia. Pl. 30 to 1 foot.**

7 R. *Lutea* (Michx. fl. bor. amer. 1. p. 222.) stem quadrangular, hispid; leaves furnished with a few long hairs, lower ones cuneate-oblong, obtuse; upper ones lanceolate; calyx margined, with the lobes acute; anthers short. 2. F. Native of Georgia and Florida. Flowers yellow. Petals oval, obtuse. 

Yellow-flowered Rhegia. Pl. 30 to 1 foot. 

**Narrow-leaved* Rhegia. Fl. June, Aug. Ct. 1812. Pl. 30 ft.**

N. B. Rhegia linearifolia of Poir is *Ismardia alternifolia*. 

**Cult.** All the species of this genus are very elegant when in flower, and if planted in a bed of peat soil (which is the only soil in which they grow) they will thrive and increase abundantly; and if grown in pots, which is sometimes the case, they must be planted in peat soil. They are all increased by dividing at the root. 

**XXIV. HETERONO'MA** (from *îrōs, hetero* and *wvôma, areg, name, atos; original form; inequality of leaves). D. C. prod. 3. p. 122. 

**LIN. Syst. Octândria, Monogyniâ.** Calyx tubular, with 4 triangular, acute, permanent teeth. Petals 4, oval, somewhat mucronate. Stamens 8. Anthers alternately longer; in the longer anthers the connective is drawn out into a linear appendage, which is bifid at the apex; in the smaller or shorter ones it is drawn out into 2 bristles. Capsule 4-celled, equal in length to the calyx. Seeds coarctate, compressed, wrinkled transversely, scabrous, the stripes on the back parallel.—A glabrous herb. Branches tetragonal. Leaves petiolate, ovate, acute, 5-nerved, ciliately serrate, ovate, very unequal in size, the one large and the other small. Cymes corymbose, few-flowered, loose, terminal. Flowers elegant, rose-coloured. 

**Diverse-leaved* Heteronoma. Pl. 2 feet.** 

**Cult.** Petal is the best soil for this plant; and cuttings will root in the same kind of earth under a hand-glass, in heat. 

**XXV. PACHYLO'MA** (from *wvô&, pachy, and *wvôma, toma, a fringe; in reference to the thick marginal nerve of the leaf). D. C. prod. 3. p. 122. 

**LIN. Syst. Octândria, Monogyniâ.** Tube of calyx obconically cylindrical, drawn out beyond the ovarium; limb somewhat truncate, hardly 4-toothed. Petals 4, oval. Stamens 8, equal. Anthers linear, elongated, acuminate, opening by one pore; having the connectives in 4 of them long and drawn out into a simple bristle-like appendage; in the other 4 it is drawn out into 2 bristle-like appendages. Ovarium free, 4-ribbed, glabrous. Style filiform, exserted. Stigma dot-formed. Fruit unknown.—Smooth Brazilian shrubs. Branches terete, nodose at the insertion of the leaves. Leaves on short petioles, oval, 5-nerved, besides being margined by a thick nerve, coriaceous, quite entire. Thyspe ponicled, loose, terminal, branchlet. Flowers purple. The character of this genus is very doubtful, from the fruit being unknown, but the habit is very singular. 

1 P. *Coriaceum* (D. C. l. c.) 2. S. Native of Brazil, in the province of Rio Negro, and at the river Amazon. Rheïxa pachyîoma, Mart. herb. 

**Var. α, glaberrîma (D. C. l. c.) calyces glabrous; leaves oblong.** Rheïxa bicuspis, Schrank, mss. 

**Var. β, subsectîa (D. C. l. c.) calyx covered with glandular bristles; leaves ovate.** Rheïxa Amâzonîum, Schrank, mss. 

In both varieties the leaves vary in the same specimen, and are cleft in a singular manner at the apex, the points cross over each other in the manner of the bill of a cross-beak, Loxia of Lin. 

**Coriaceous-leaved* Pachyloma. Trec 30 to 40 feet.** 

**Cult.** See *Meyeriâ* (p. 783.) for culture and propagation. 

**XXVI. OXYSPORA** (from *wvô&, wvôz, sharp, and *wvôra, spora, a seed; in allusion to the seeds being awned at both ends). D. C. prod. 3. p. 123.—Arthrostemâ genus, D. Don, in wern. soc. mem. l. c. 

**LIN. Syst. Octândria, Monogyniâ.** Tube of calyx oblong; lobes 4, ovate, mucronulate. Petals 4, lanceolate, obliquely acute. Stamens 8, equal; filaments flatish. Anthers elongated, drawn out at the base into 2 blunt spurs, having their connectives hardly evident. Capsule 4-celled, 4-valved. Seeds small, hardly curved, armed at both ends; with the hyaline cove and terminal.—Sirsubs, native of Nipaul. Leaves petiolate, elliptic, oblong, acuminate, dentilicate, 5-7-nerved, glabrous on the upper surface. Thyspe ponicled, terminal. Flowers red, drooping. 

1 O. *va'gans* (Wall. pl. rar. assit. 1. p. 78.) rather climbing; branches nodding; leaves somewhat cordate-ovate, acuminate, crenulated, ciliated, clothed with tomentose villi on the under surface, as well as on the branchlets and petioles; petiole elongated, nodding; connectives of anthers all spurred upwards; calyx ribbed. 2. G. Native of Chittagong. Melastoma vâgans, Roxb. mss. Flowers red. 

**Var. β, ecn'lua (Wall. l. c.) leaves ovate-lanceolate, 5-nerved, glabrous; petiole terminal, slender, elongated, nodding; peduncles 4-winged.** 2. S. Native of Chittagong. Melastoma cn'lua, Roxb. mss. 

**Common Oxyloxyrs.** Shrub 2 to 4 feet. 

**Panicled-flowered* Oxyloxyrs.** Shrub 2 to 4 feet. 

**Cult.** For culture and propagation see *Lasîndra*, p. 752. Both are very elegant shrubs when in blossom. 

**XXVII. TRICE'NTRUM** (from *trîc, trîs, and *wvôp, kentron, a spur; in reference to the connectives of the anthers being furnished with three spurs at the base). D. C. prod. 3. p. 123. 

**LIN. Syst. Octândria, Monogyniâ.** Tube of calyx ovate; lobes 4, narrow, acute, usually ending in three bristles each at the apex. Petals 4, oblong or oval. Stamens 8; filaments glabrous; anthers similar, linear, opening by one pore, beaked; having their connectives furnished with 3 spurs each, 2 of the spurs are above and 1 behind. Ovarium free, not brilliantly at the apex. Style filiform. Capsule ovate, 4-celled. Seeds coarctate.—Small South American shrubs. Flowers rose-coloured, solitary, nearly like those of *Rheïxa.* 

1 T. *Ovalîfoliûm* (D. C. l. c.) beset with glandular pili in
MELASTOMACEAE. XXVII. MELASTOMACEAE. XXVIII. MARCETIÀ.

every part; branches somewhat tetragonal; leaves ovate, mucronate, villous, 5-nerved; flowers bicaricate, on short pedicels in the axils of the upper leaves. h. S. Native of Brazil.

MARCETIA (dedicated by De Candolle to his friend Fr. Marcet, who has advanced vegetable physiology by a singular memoir on the effects of poison on living vegetables), D. C. prod. 3. p. 124.

Linn. syst. Octandria, Monogygma. Tube of calyx oblong or cylindrical; lobes 4, lanceolate. Petals 4, oval, acute. Stamens 6, equal; anthers oblong, furnished with 2 tubercles at the base, opening by one pore. Ovarium free, glabrous. Style filiform. Stigma 5-nerved. Capsule 4-valved, 4-celled, about equal in length to the tube of the calyx. Seeds coccileate.—Brazilian shrubs. Branches terete. Leaves rather fleshy, oblong, usually with revolute edges, cordate at the base, on very short petioles or almost sessile, quite entire, usually nerveless. Flowers axillary, solitary, almost sessile, bicaricate, white or reddish.

1 M. decussata (D. C. L. c.) suffruticose, branched; leaves sessile, ovate, rather cordate, blunter, quite entire, 3-nerved at the base, downy, as well as the branchlets and calyces; flowers axillary, pedicellate; lobes of calyx lanceolate-subulate, hardly shorter than the tube; petals oval, acute. h. S. Native of Brazil, in the province of Bahia, on woody mountains, at the height of 2000 feet. Rhexia decussata, Mart. et Schrank, mss. Leaves hardly 2-3 lines long. Genitals exserted. Stamens alternate unequal, but similar to the rest. Anthers furnished with 2 tubercles at the base. Seeds wrinkled, truncate at the base.

Decussate-leaved Marcetia. Sh. 1 foot.

2 M. corticéra (D. C. L. c.) shrubby, much branched; branches hispid from bristles; leaves sessile, cordate, when young revolute at the margins, but at length becoming flat, and truly heart-shaped, rather scabrous from minute glandular down; flowers axillary, pedicellate, solitary, disposed in a leafy raceme; petals obliquely mucronate. h. S. Native of Brazil, in the province of Rio Janeiro, on the Alps. Rhexia cordigera, Mart. et Schrank, mss. Flowers white. Allied to M. taxifolia.

Heart-bearing Marcetia. Sh. 1 foot.

3 M. exobriàta (D. C. L. c.) suffruticose, much branched; leaves almost sessile, oblong, rather cordate at the base, obtuse at the apex and mucronate, densely clothed with down, somewhat 3-nerved; flowers axillary, pedicellate, disposed in short leafy racemes; anthers furnished with 2 tubercles at the base. h. S. Native of Brazil, on the mountains between Villa Rica and Tejuco. Rhexia exobriàta, Mart. et Schrank, mss. Bark at length separating from the stem. Leaves with a bluntish mucron, covered with resiniferous down. Teeth of calyx linear. Petals oblong-obovate, rose-coloured. Genitals exserted. Seeds hardly wrinkled, truncate at the base.

Exocortate Marcetia. Sh. 2 to 3 feet.

4 M. taxifólia (D. C. L. c.) shrubby, much branched, clothed with glandular down in every part; leaves nearly sessile, oval-oblong, nearly linear, cordate at the base, with the margins revolute; flowers axillary, solitary; calyx covered with glandular hairs, with 4 oblong-linear lobes; petals obliquely mucronate. h. S. Native of Brazil, in the province of Minas Geraes, in sandy places. Rhexia taxifólia, St. Hil. in Bonpl. rhex. t. 57. Flowers white, on pedicels, which are furnished with one bractea each.

Var. β, cinérea (D. C. L. c.) the whole plant almost white from short cinereous down. h. S. Native of Brazil, in the province of Minas Geraes, at the height of 4000 feet, in fields. Rhexia cínerea, Mart. herb. Flowers purplish.

Yew-leaved Marcetia. Sh. 1 to 2 feet.

5 M. glandulósa (D. C. L. c.) shrubby, much branched; branches thickly beset with glandular hairs; leaves sessile, oval-oblong, but nearly lanceolate from the margins being revolute, cordate at the base, nerveless, crowded, ornamented with glandular hairs; flowers axillary; pedicels short, bicaricate in the middle; lobes of calyx subulate. h. S. Native of Brazil, in the province of Minas Geraes. Rhexia quadrivalvális, Mart. herb. Flowers purplish, a little larger than those of M. taxifólia.

Glandular Marcetia. Sh. 1 to 2 feet.

6 M. purescens (D. C. L. c.) shrubby, branched; branches clothed with glandular down; leaves sessile, oval-oblong from the revolution of the margins, oblong, cordate at the base, downy, not glandular, nerveless; flowers axillary, almost sessile; bracteoles small, setaceous; lobes of calyx short. h. S. Native of Brazil. Rhexia Langsdorffiana, Kunth ex Mart. Flowers purplish.

Pubescent Marcetia. Sh. 1 to 2 feet.

7 M. tenuifólia (D. C. L. c.) shrubby, much branched; branches rather tetragonal, clothed with short hispid down; leaves sessile, linear, nerveless, clothed with short velvet down, revolute at the margins; pedicels axillary, short, 1-flowered, furnished with 2 bracteas each. h. S. Native of Brazil. Rhexia tenuifólia, Mart. herb. Allied to M. taxifólia, from the white flowers, but differs from it in the down not being glandular, and in the leaves being narrower and more spreading.

Fine-leaved Marcetia. Sh. 1 to 2 feet.

8 M. juniperína (D. C. L. c.) suffruticose; branches slender, downy; leaves lanceolate, but linear from the revolution of the edges, acute, nerveless, clothed with rough pubescence; flowers axillary, solitary, sessile, bicaricate; lobes of calyx linear-subulate; petals oval-oblong, awned mucronate. h. S. Native of Brazil. Rhexia juniperína, Spreng. syst. 2. p. 310. Juniper-like Marcetia. Sh. 1 foot.

9 M. tamaríssëna (D. C. L. c.) shrubby; leaves sessile, rather fleshy, oblong, cordate, with revolute margins, and hence as if they were sagittately cordate; flowers axillary, almost sessile; petals lanceolate. h. S. Native of Brazil, in the province of Minas Geraes. Rhexia tamaríssëna, Schrank et Mart. mss. Leaves, branches, and calyces rather downy; lobes of calyx narrow, acute, aceros. Petals white. Stamens similar. Anthers rather tumid at the base. Seeds truncate at the base. Leaves almost like those of Empétrum. Very near M. taxifólia.

Tamarisk-like Marcetia. Sh. 1 to 2 feet.

10 M. acoëosëa (D. C. L. c.) suffruticose, very humble; leaves clothed with velvet down, oblong-linear with revolute edges; flowers solitary, terminal, erect, sessile; genitins shorter than the petals, which are orbicular, and hardly apiculated. h. S. Native of Brazil, in the province of Minas Geraes, in the Cerrão or desert, in stony sandy fields. Rhexia acóesëa, Schrank et Mart. mss. A small heath-like shrub. Leaves 1-2 lines long. Branches filiform. Anthers ovate, hardly auricled at the base. Petals purple. Allied to M. taxifólia from the leaves, but differs in the flowers being 4-petalled and octandrous. Habit of Tetrathëca.

Needle-leaved Marcetia. Sh. 1 foot.

11 M. sertulària (D. C. L. c.) shrubby, branched; branchlets and leaves rough from thick glandular down; leaves sessile,
ovat, with revolute margins, nerveless, small, crowded, coriaceous; flowers solitary at the tops of the branches; calyx oblong, beset with short, glabrous hairs. S. Native of Brazil, in the province of Minas Geraes, at the height of 5000 feet. D. C. coll. mem. l. t. 5. Rhedia serrulata, Schrank et Mart. ms. Stamens exerted. Petals oval, white in a dried state. Very elegant and very distinct from the other species.

Serrulata-like Marcetia. Shrub 1 foot.

Culm. The species of Marcetia are elegant little shrubs, but probably of calyx, but differing in the corolla being pentametaceous. The habits of the species are heterogeneous, but the characters are not so. The genus is therefore divided into 3 sections.

Sect. I. Jacobia (dedicated to James Andr. Trembley, who wrote a thesis on vegetation, which has been falsely attributed to Calandrini, a Swiss botanist). D. C. prod. 3. p. 125. Calyx tubarhine, hardly constricted at the apex; lobes subulate. Petals oval, mucronate. Connectives of anthers drawn out into a short appendage each. Flower solitary, yellow. This section almost agrees with the genus Marcetia, but differs in the petals being yellow. Perhaps a proper genus. Seeds unknown.

1 T. Rosmarinoides (D. C. prod. 3. p. 125.) shrubby, much branched, glabrous; branches tetragonal; leaves on short petioles, linear, quite entire, 3-nerved, beside 2 marginal veins, which are joined with the reticulating veins, clothed with yellowish down beneath; flowers axillary, solitary, pedicellate, and at the tops of the branches; tube of calyx ovate, somewhat costate, equal in length to the lobes, which are subulate, and 5-6 in number; anthers dissimilar. S. Native of Brazil, in the province of Minas Geraes, on the tops of mountains, at the elevation of 5000 feet. Rhedia rosmarinoides, Schrank et Mart. ms. Petals obovate, yellow. Anthers ovate, with short blunt beaks; the alternate ones furnished with a longer auricled connective each.

Rosemary-like Trembleya. Shrub 1 foot.

Sect. II. Abrahama (in honour of Abraham Trembley, see genus). D. C. prod. 3. p. 126. Calyx urceolate; lobes subulate or linear. Petals not gradually mucronated but apiculate. Connectives of anthers drawn out into a broad appendage each. Flowers purplish, pedicellate.

2 T. Philogophis (D. C. l. c.) plant suffruticose, oppositely branched; branches somewhat tetragonal, beset with glabrous hairs; leaves sessile, elliptic-oblong, attenuated at both ends, ciliately serrated, 3-nerved, hispid on both surfaces; pedicels 1-flowered, axillary, and at the tops of the branches; calyx rather hispid, with an urceolate tube, and a limb which is campulate at the base and 5-lobe at the apex, the lobes ending in setaceous points, hardly shorter than the tube; anthers dissimilar. S. Native of Brazil, in the province of St. Paul, in fields. Rheidad phlogiophis, Mart. et Schrank, ms. Petals oblong-oblong, purple. Anthers 10, ovate, with short blunt beaks; the 5 longer ones having their connectives drawn out into a broad obcordate appendage each, and those of the 5 shorter ones drawn out into a small narrow appendage each. Capsule ovate, 5-lobed; sepal.

Phlox-leaved Trembleya. Shrub 1 to 2 feet.

3 T. Agrestis (D. C. l. c.) shrub; branches bluntly tetragonal; leaves elliptic-oblong, cuneated at the base, rather acutish, quite entire, 3-nerved, pruinose on both surfaces as well as the branchlets; upper ones pilose as well as the calyces; flowers solitary, terminal; lobes of calyx 5, oblong, a little longer than the tube; petals obovate, cuneated. S. Native of Brazil, in the province of Minas Geraes, in elevated stony fields. Rheidad agrestis, Mart. et Schrank, ms. Leaves 7-9 lines long and 3 lines broad. Flowers small. Anthers oblong-oblong, ending in very short beaks, but having their connectives drawn out into a long, club-shaped process each at the articulation; inner anthers furnished with shorter connectives. The rest unknown.

Field Trembleya. Shrub 1 to 2 feet.

4 T. Heterostemon (D. C. l. c.) shrub; branches bluntly tetragonal, when young clothed with woolly villi; leaves petiolate, lanceolate, cuneated at the base, obtuse at the apex, quite entire, 3-nerved, clothed with velvety tomentum beneath, smoothish above; cymes 5-7-flowered, axillary, 3-times shorter than the leaves; calyx turbinate, globose, with 5 short teeth; anthers 10, dissimilar. S. Native of Brazil, in the province of Minas Geraes, near subalpine fountains. Rheidad heterostemon, Mart. et Schrank, ms. Leaves 2 inches long, and 5 lines broad. Petals oblong, white. Anthers ovate, short, ending in short beaks, 5 of which are spurious, and the other 5 having their connectives drawn out at the base into an obcordate appendage each, which is about equal in length to the anther.

Variable-stamened Trembleya. Shrub.

5 T. triflora (D. C. l. c.) shrub; branches tetragonal, glabrous; leaves petiolate, oblong-lanceolate, quite entire, 3-nerved, glabrous above, but white beneath from very minute down; pedicels axillary, 3-flowered, angular; calyx turbinated, glabrous, with 5 triangular short lobes; anthers dissimilar. S. Native of Brazil, in the province of Minas Geraes, in woods near Villa Rica. Rheidad triflora, Mart. et Schrank, ms. Petals obovate, oblong, 3-4 lines long, not ciliated. Anthers 10, ovate, ending in short beaks, 5 of which have their connectives drawn out into a yellow retuse appendage each.

Three-flowered Trembleya. Shrub 2 feet.

6 T. Lycanthus (D. C. l. c.) shrub, clothed in every part with white woolly tomentum, except the petals, genitales, and the upper surface of the adult leaves; branches terete; leaves almost sessile, ovate, or somewhat oblong, 3-nerved, quite entire; flowers axillary, sessile, somewhat verticillate; tube of calyx turbinate, equal in length to the lobes, which are 5, oblong, and glabrous inside; anthers dissimilar. S. Native of Brazil, in the province of Minas Geraes, in exposed stony places on the sides of mountains. Rheidad lycanthus, Schrank et Mart. ms. Me-
MELASTOMACEÆ. XXX. ADELLOBOTRYS. XXXXI. LASIA'NDRA.

XXX. ADELLOBOTRYS (from adelos, adelos, obscure, and botrys, botrys, a raceme; in reference to the flowers not being sufficiently known). D. C. prod. 3. p. 127.

Lin. syst. Decândria, Monogyânia. Calyx free, somewhat campanulate, with 5 short blunt teeth. Petals 5, oval. Stamens 10. Anthers bifurcate at the base, and 2-valved? at the apex. Ovary and style unknown. Capsule bursting by 5 parts, with the central column at length free from the valves. — Seeds unknown. — A climbing shrub with terete branches. Leaves clothed with rufous villi on both surfaces when young, but in the adult state glabrous, except the nerves, petiolate, ovate-cordate, acuminate, ciliately serrated, 5-nerved. Flowers white, crowded in cymeous heads at the tops of the branches.

Climbing ADELLOBOTRYS. Shrub cl.

Cult. For culture and propagation see LASIA'NDRA, p. 753. Being a climbing shrub it is fit for covering rafters in stoves.

Tribe III.

OSBE'CKIA (plants agreeing with Osbèckia in important characters). D. C. prod. 3. p. 127. Anthers opening by 1 pore at the apex. Ovary sometimes free, and sometimes adnate to the calyx, crowned by scales or bristles at the apex. Seeds coccolate, with a basilar orbicular hyolum. The species are natives of America, Africa, Asia, and a few of Australia.

XXXI. LASIA'NDRA (from lasios, latios, hairy, and avôp avôpoc, aver avôdros, a male; in reference to the hairy stamens). D. C. prod. 3. p. 127. Rhéâxia species, Schrânt and Mart. mss.

— Plerôma species, D. Don, l. c.

Lin. syst. Decândria, Monogyânia. Tube of calyx ovate; lobes 5, narrow, acuminated. Petals 5, obovate. Stamens 10; filaments pilose; anthers elongated, terminating in short beaks, having their connectives tumid and biauriculate at the base. Ovary setose at the apex, probably somewhat adnate to the calyx in the young state. Style usually pilose. Capsule dry, 5-celled. Seeds few, coccolate, rather angular, with a somewhat orbicular, basilar hyolum. — Shrubs, natives of South America. Branches clothed with adpressed bristles. Leaves on short petioles or sessile, 3-5-nerved, quite entire, ciliated, bristly on the upper surface; the bristles adpressed, and usually regularly directed from the middle to the nerves; villous or setose on the nerves beneath, and velvety or villous between the nerves. Flowers large, purple, disposed in terminal racemes or panicles; before expansion hidden by 2 bracteas each, which fall off as the flower expands. The species have the habit of Plerôma, but differ in the genitils being hispid, and in the capsule being dry and free, not baccate and adnate to the calyx.

* Calyx rough from stiltish bristles.

L. frígí'dula (D. C. prod. 3. p. 127.) branches somewhat compressed, smoothish; leaves sessile, somewhat cordate at the base, oval-oblong, acute, quite entire, 3-nerved, glabrous; peduncles axillary, trichotomously cymose, disposed in a panichel thyrs; bracteas involving the flower-bud when young; calyx bristy, with 5 ciliated lobes; petals ciliated; filaments rather pilose. 5. S. Native of Brazil, in the alpine fields of Serro Frio. Rhéâxia frigí'dula, Schrânt et Mart. mss. Style much elongated.

FRIGID LASIA'NDRA. Shrub 2 to 3 feet.

L. trîfofí'a (D. C. l. c.) branches trigonal, roughish; leaves 3 in a whorl, almost sessile, oblong, quite entire, acute, 3-nerved, glabrous in the disk above, but beset with adpressed bristles beneath and on the margins; panicle terminal; calyx bristy, with 5 ciliated deciduous lobes; petals ciliated; filaments lispid; style glabrous. 5. S. Native of Brazil, in the province of St. Paul, in fields and on the edges of woods. Leaves 3 inches long, but hardly an inch broad. Pedicels and calyces bristy. Rhéâxia trîfofí'a, Schrânt et Mart. mss.

Three-leaved LASIA'NDRA. Shrub 2 to 3 feet.

L. Martí'tu'sā'na (D. C. l. c.) shrubby; branches nearly terete, beset with adpressed bristles; leaves sessile, ovate, 3-nerved, quite entire, glabrous above, dotted beneath but hardly bristy; thyrs terminal; bracteas 2, oval, half involving the flower-bud; calyx bristy, with an obovate tube; & oval-oblong ciliated lobes, which are longer than the tube; filaments hispid; anthers rather dissimilar. 5. S. Native of Brazil, in the province of Minas Geraes in fields, at the elevation of 2000 feet. Rhéâxia Lasiàndra, Schrânt et Mart. mss.

Martins's LASIA'NDRA. Shrub 2 to 3 feet.

L. Morìc'ândi'â'na (D. C. prod. 3. p. 128.) shrubby; branches nearly terete, clothed with short adpressed villi; leaves petiolate, oblong, acute, 3-5-nerved, clothed with adpressed bristles above and pale villi beneath; flowers in threes, terminal; bracteas ovate, clothed with adpressed villi, large; tube of calyx campanulate, bristy, longer than the lobes; filaments beset with glandular pili. 5. S. Native of Brazil. Rhéâxia Morìcândiâ'na, Scr. mss. Anthers long, having their connectives furnished with 2 tubercles at the base. Lobes of calyx at length deciduus. The outer nerves of the leaves almost marginal.

Morìcand's LASIA'NDRA. Shrub 2 to 3 feet.

L. Maxi'mi'lia'na (D. C. l. c.) branches tetragonal, and are as well as the petioles and peduncles scabrous from bristles; leaves petiolate, ovate, obtuse at the base, acute at the apex, 5-nerved, bristly above, nerveless beneath, but with the nerves beset with silky bristles; thyrses panicled, corymbos; terminal; bracteas, and outside of calyx scabrous from adpressed bristles; style glabrous; filaments rather pilose at the base. 5. S. Native of Brazil, where it was collected by Prince Maximilian de Neuweid. Very like L. Gaú'dichâuduiâ'na, but differs in the bristles being more stiff and harsh.

Maximilian's LASIA'NDRA. Shrub 4 to 6 feet.

L. Gaú'dichâuduiâ'na (D. C. l. c.) branches tetragonal, rough from small adpressed bristles; leaves petiolate, ovate, acuminated, 5-nerved, beset with small, softish bristles on both surfaces; panicle terminal; bracteas acuminated, shorter than the tube of the calyx; calyce line tube ovate, clothed with adpressed bristles, twice the length of the lobes, which are acuminated; filaments rather pilose; style glabrous. 5. S. Native of Brazil. Lateral nerves of leaves forming a margin. Anthers long, falcate, having their connectives hardly drawn out into a thick appendage at the base.

Gaú'dichâuduiâ'na's LASIA'NDRA. Shrub 2 to 3 feet.

L. Ochî'pe'tâla (D. C. l. c.) branches tetragonal, and are as well as the petioles, peduncles, and upper surface of leaves beset with adpressed bristles; leaves petiolate, oblong, acuminated, 5-nerved, beset with small, softish bristles on both surfaces; panicle terminal; bracteas acuminated, shorter than the tube of the calyx; calyce line tube ovate, clothed with adpressed bristles, twice the length of the lobes, which are acuminated; filaments rather pilose; style glabrous. 5. S. Native of Peru, on the mountains. Rhéâxia ochî'pe'tâla, Ruiz et Pav. II. per. 5. p. 86. t. 391. f. a. Rhéâxia ochî'pe'tâla, Spreng. syst. 2. p. 306.

**Sharp-petalled Lasiandra.** Shrub 10–12 feet.

8 **L. Kuntianá** (D. C. L. c.) branches tetragonal, and are as well as the petioles clothed with adpressed villi; leaves petiolate, oblong, acute, 5-nerved, quite entire, scabrous above from little bristles, but white from adpressed silky villi beneath; pedicels hispid, axillary, 1-flowered, and terminal; tube of calyx campanulate, beset with stiff bristles, but with the lobes deciduous; filaments and style hispid. 7. S. Native of Brazil. Petals very blunt. Ovarium bristly at the apex, rather longer than the tube of the calyx. Bracteas large, deciduous.

**Kuntianá Lasiandra.** Shrub 4 to 6 feet.

9 **L. Æmula** (D. C. L. c.) shrub; branches, petioles, and peduncles clothed with hairyomentum; leaves petiolate, ovate, mucronately acute, 5-nerved, quite entire, scabrous from bristles above, but densely clothed with adpressed villi beneath; pedicels rising from the upper axils of the leaves, and solitary at the tops of the branches, disposed in something like racemes; calyx bristly, with a globose tube; and 5 lanceolate deciduous lobes, which are glabrous inside. 7. S. Native of Brazil, in the province of Minas Geraes. Meriánia æmula, Schramp and Mart. mss. Ovarium bristly at the apex. Filaments and style hairy. Very like *L. hygrophila*.

**Emulous Lasiandra.** Shrub 4 to 6 feet.

10 **L. Hygrophiла** (D. C. L. c.) shrub; branches terete, hispid from bristles; leaves sessile, ovate, acute, 5-nerved, ciliately serrated, rough from stiff bristles above, but hairy beneath; pedicels axillary, 1-flowered, disposed in racemose cymes; calyx bristly: with 5 subulate lobes, which are a little longer than the tube. 7. S. Native of Brazil, in the province of St. Paul, in bogs in woods. Rhéxia hygrophila, Mart. mss. Leaves hardly an inch long and 8–9 lines broad. Like *L. Tomnésii*, but differs in the anthers being shorter, and in the filaments bearing a few subglandular hairs.

**Water-loving Lasiandra.** Shrub 4 to 6 feet.

11 **L. Tibouchínoidés** (D. C. L. c.) shrub; branches bluntly tetragonal, beset with bristly pili; leaves petiolate, elliptic-oblong, mucronate, quite entire, 3-nerved, bearing a few scattered bristles above, but clothed with villousomentum beneath; flowers terminal, bracteate, usually twin; calyx bristly, with 5, ovate, acute, ciliate lobes. 7. S. Native of Brazil, in the province of St. Paul, in marshes. Rhéxia tibouchínoidés, Schramp and Mart. mss. Leaves an inch long and 5–6 lines broad. Calyx ovate, red; lobes 5. Petals large. Anthers linear, falcate, acuminated by the beaks, a little longer than the connective, which are tumid at the base. Stamens exerted, rather unequal, glabrous, and bearing a few glands at the very base. Habit of *Tibouchina* of Aublet or *Chetográstrá lepidótá*.

*Tibouchina-like Lasiandra.* Shrub 6 to 8 feet.

12 **L. Hóspita** (D. C. prod. 3. p. 129.) shrub; much branched, scabrous in every part from adpressed bristles; branchlets somewhat tetragonal; leaves on short petioles, elliptic, 3-nerved, quite entire, acute; pedicels axillary, 1-flowered; calyx globose, scarcely 5-toothed; capsule 5-celled. 7. S. Native of Brazil, in the province of Minas Geraes, on the mountains, in cold places. Rhéxia hóspita, Schramp and Mart. mss. Leaves an inch long. The bristles on the leaves regularly disposed between the veins. Bracteas deciduous. Stamens unknown. The branches becoming tumid from a species of cympis.

**Stranger Lasiandra.** Shrub 2 to 3 feet.

13 **L. Macscúron** (D. C. L. c.) shrub; branches tetragonal, beset with adpressed little bristles; leaves petiolate, oval, 3-nerved, beset with adpressed bristles above, but with dot-like setae beneath; thryse terminal; bracteas 2, rather villous, involving the flower in its young state; calyx bristly, with an ovate tube, and 5 ovate, ciliated, longer lobes; filaments hispid; anthers long, nearly similar. 7. S. Native of Brazil. Rhéxia macrochiton, Mart. mss. Petals ciliated when young. Anthers falcate, beaked.

**Long-coated Lasiandra.** Shrub 2 to 3 feet.

* Calyx clothed with adpressed, rather silky villi.

14 **L. Thereminiana** (D. C. L. c.) shrub; branches terete, clothed with adpressed short villi; leaves petiolate, ovate, acute, quite entire, 7-nerved, clothed with canescent villi beneath, villous above; flowers solitary, terminal; bracteas 2, ovate; villi on calyx silky and adpressed; calyceine lobes longer than the tube, which is very villous; filaments villous; appendages of the connectives of the anthers bearing scattered glands. 7. S. Native of Brazil. Very like *Chetográstrá muricata*, but differs in the longer petaloid 7-nerved leaves; the flowers are also larger, and biflacteate and the anthers shorter.

**Thereminian Lasiandra.** Shrub 8 to 10 feet.

15 **L. Semidecandra** (Schrank et Mart. mss. ex D. C. L. c.) shrub; branches tetragonal, villous; leaves petiolate, ovate, acute, quite entire, 5-nerved, rough from stiff bristles above, but villous beneath; flowers solitary, terminal, and axillary, pedicellate; bractees bristly, deciduous, involving the flower-bud before they fall off; calyx clothed with silky villi: with 5 acuminate lobes, which are glabrous inside and longer than the tube. 7. S. Native of Brazil, in the province of Minas Geraes, on the mountains. Rhéxia semidecandra, Schramp et Mart. mss. Bracteas silvery. The rest as in *L. hygrophiла*. Flowers as in *L. Fontenasiana*. The 5 alternate stamens larger; anthers falcate; having their connectives knotted at the base, and twice the length of the anthers. Style pilose.

**Semidecandrous Lasiandra.** Shrub 4 to 6 feet.

16 **L. Candolleána** (D. C. L. c.) shrub; branches nearly terete, rough from small adpressed bristles; leaves petiolate, oval-oblong, attenuated at both ends, triple-nerved, membranous, quite entire, clothed with adpressed bristles on both surfaces; pedicels axillary, solitary, tern; bracteas oval, oblong, acute, deciduous; calyx white from adpressed villi, having its lobes longer than its tube, which is ovate; style and filaments hispid. 7. S. Native of Brazil, at Rio Grande de Belmonte. D. C. Coll. 1. f. 6. Rhéxia Candolleána, Mart. herb. Allied to *L. Fontenasiana*, but differs in the lateral nerves of the leaves being simple, not bifid. Petals violaceus, ciliated when young. Stamens 10, alternate ones rather the smallest.

**De Candolleá's Lasiandra.** Shrub 2 to 3 feet.

17 **L. Raddeána** (D. C. L. c.) shrub; branches somewhat tetragonal, furnished with a few adpressed bristles; leaves petiolate, oblong, acuminate at both ends, quite entire, smoothish, but bearing a few adpressed bristles, 3-nerved; flowers terminal, usually solitary; calyx densely clothed with adpressed silky villi. 7. S. Native of Brazil. Rhéxia unifóra, Raddei. mem. l. c. p. 9. but not of Vahl. Rhéxia Raddiána, Moreian. herb. Ser. mss. Flowers large. Style and filaments hispid. Lobes of calyx deciduous.

**Raddi's Lasiandra.** Shrub 4 to 6 feet.

18 **L. Fontenasiana** (D. C. prod. 3. p. 130.) branches tetragonal; angles winged; pedioles, peduncules, and upper surface of leaves beset with adpressed bristles; leaves petiolate, oblong, acute, 5-nerved, beset with adpressed bristles beneath on the nerves and on the margins, the rest clothed with white stellate velvety down; racemes terminal; pedicels opposite, 1-3-flowered; calyx very villous, white; filaments very hairy. 7. S. Native of Brazil, about Rio Janeiro and St. Paul. Rhéxia Fontenasáni, Bonpl. rex. t. 36. Rhéxia alátus, Raddei. mem. p. 8. Melastoma granulósus, Desr. in Lam. dict. 4. p.

Var. β, angélist (D. C. l. c.) leaves not half the breadth; flowers smaller.

Desfontain’s Lasiandra. Shrub 5 to 8 feet.

19 L. fismaevia (D. C. l. c.) branches tetragonal, not winged; petioles, peduncles, and leaves beset with adpressed bristles; leaves petiolate, oblong, acute, 5-nerved or only 3-nerved, with the 2 lateral ones bident, beset with adpressed bristles on the margins and on the nerves on the under surface, the rest velvety from dense stellate down; flowers racemose; peduncles opposite, 1-3-flowered; calyx clothed with adpressed white pubescence; filaments hairy; style glabrous. ♂. S. Native of Brazil, in the province of Minas Geraes. Rhéxia fissimére, Schrank et Mart. mss. Like L. Fontanesiunum, but differs in the stem being tetragonal, not winged, in the calyx being less villous, and in the flowers being smaller.

Cleft-nerved Lasiandra. Shrub 5 to 10 feet.

20 L. stenocera (D. C. l. c.) branches tetragonal, having the angles rather winged, and are as well as the petioles and peduncles clothed with adpressed stiff villi; leaves on short petioles, oblong, acute, mucronate, 5-nerved, quite entire, beset with adpressed bristles above, and silky villi beneath; flowers panicled; branches of panicle tetragonal, opposite, 3-flowered; calyx clothed with adpressed villi; filaments hairy; style rather pilose. ♂. S. Native of Brazil, in rocky places near Maraca, in the province of Bahia. Rhéxia Estrelénm, Raddi, mem. p. 0.7. Rhéxia stenocera, Schrank et Mart. mss. Allied to L. Fontanesiunum, but differs in the flowers being smaller, and especially in the down, which is very distinct.

Narrow-fruited Lasiandra. Shrub 5 to 8 feet.

21 L. Langsdorfiun (D. C. l. c.) branches tetragonal, having the angles winged, beset with bristles as well as the peduncles; petioles short, villous; leaves oval, acute from a mucrone, 5-nerved, clothed with adpressed bristles above, and with adpressed villi on the nerves beneath, and soft stellate tomentum between the nerves; peduncle thyrsoid, terminal, many-flowered; calyx clothed with adpressed white villi, with an ovate tube, and lanceolate, deciduous lobes; filaments and style beset with bristles. ♂. S. Native of Brazil, in exposed fields in the provinces of Rio Janeiro and St. Paul. Rhéxia Langsdorfiun, Bonpl. rhex. t. 51. Osbéckia Langsdorfiun, Spreng. syst. 2. p. 312. Allied to L. Fontanesiunum, but differs in the leaves being ovate at the base, and rather rufescent beneath. Thyrsre panicule-formed. Stamens beset with glandular pili.

Langsdorfi’s Lasiandra. Shrub 5 to 6 feet.

22 L. proteforfiun (D. C. l. c.) branchlets acutely tetragonal, and are as well as the peduncles beset with bristles; petioles hardly any, villous; leaves ovate, mucronate, 5-nerved, densely clothed with adpressed silky villi on both surfaces, the down on the under surface stellate; thyrsre pilose, pilose and many-flowered; calyxes and calyces very villous; lobes of calyx lanceolate, acute; petals a little ciliated, twice the length of the calyceine lobes; style and filaments beset with a few hairs. ♂. S. Native of Brazil, in woods, and in bushy exposed places in the province of Minas Geraes. Rhéxia proteforfiun, Schrank et Mart. mss. Allied to L. Langsdorfiun, but differs in the flowers not being above half the size, and in the nerves of the leaves being clothed with yellowish villi.

Protea-formed Lasiandra. Shrub 5 to 6 feet.

23 L. Urvillea (D. C. l. c.) branches tetragonal, clothed with soft villi; leaves on short petioles, oval-oblong, mucronate, 5-nerved, quite entire, clothed with adpressed silky villi on both surfaces; thyrsre pilose, crowded, terminal; bracteas and calyces very villous; lobes lanceolate, acute; filaments and style beset with glandular pili, from the base to the middle. ♂. S. Native of the island of St. Catharine, in the entrance to the Rio Janeiro, where it was collected by Captain d’Urville. Petals purple, ciliate, almost bearded at the apex. Knots of branches thickly beset with spreading bristles.

Urville’s Lasiandra. Shrub 5 to 6 feet.

24 L. adenosténon (D. C. l. c.) branches tetragonally winged, and are as well as the peduncles clothed with adpressed bristles; petioles hardly any; leaves ovate, quite entire, mucronate, 5-nerved, villous above and on the nerves beneath, but clothed with stellate tomentum between the nerves on the under surface; thyrsre pilose, terminal; calyx and bracteas clothed with adpressed villi; lobes of calyx lanceolate; filaments and style pubescent and beset with glandular pili at the base; the 5 alternate filaments bearing a few thick pedicellate glands. ♂. S. Native of Brazil, about Rio Janeiro in exposed fields. Meiriàni adenosténon, Schrank et Mart. mss. Habit of L. proteforfiun, but the stamens are almost that of Macaeirea.

Gland-stamened Lasiandra. Shrub 5 to 6 feet.

Silvery Lasiandra. 11 July. Clt. 1816. Sh. 6 to 10 feet.

Cult. All the species are elegant shrubs, bearing thyrsoid panicles of large purple flowers. They grow best in a mixture of loam, peat, and sand; and young cuttings root readily if planted in the same kind of soil, placed in heat, under a handglass.

XXXII. CHETOGASTRA (from γογος, chatie, a bristle, and γαστρος, gaster, a belly; in allusion to the tube of the calyx being beset with bristles or scales), D. C. prod. 3, p. 131.

Lin. syst. Decandria, Monoïgyia. Tube of calyx tubonate, pilose, or scal; lobes 5, permanent. Petals 5, obovate. Stamens 10, with glabrous filaments and oblong anthers; anthers opening by 1 pore at the apex; having their connectives drawn out, sometimes into a simple or bifid spur, and sometimes into 2 small, obtuse tubercules. Ovarium free, bristly at the apex, and often denticulated. Capsule 5-celled. Seeds coeleste.—Shrub, rarely herbs, natives of South America, for the most part clothed with strigose pili. Leaves 3-5-nerved, quite entire, or hardly serrulated. Flowers terminal, purple, or white. This genus differs from Lasindra in the stamens being glabrous, and in the florescence; from Arthrostéma in the quinary number of the parts of the flower, not quaternary; from Osbéckia in there being no appendages between the calyceine lobes.

Sect. I. Monocestra (from μονος, mono, one, and κεντρον, ketron, a spur; in reference to the anthers having their connectives drawn out into a simple spur at the base). D. C. prod. 3. p. 131. Tube of calyx obovate or tubonate; lobes 5, lanceolate, rather dilated at the base. Anthers having their connectives drawn out into a simple spur at the base. Ovarium toothed at the apex.—Showy Peruvian shrubs, with the habit of Lasindra. Branches terete. Flowers large, purple. Perhaps a proper genus.

1 C. speciosa (D. C. l. c.) branches clothed with short, simple
MELASTOMACEÆ.

Sect. II. DIOTANTHERA (from dic, dis, two, ovæ, ovo, ovo, ova, an ear, and anthera, an anther; in reference to the connectives of the anthers being drawn out into a bifid spur or 2 auricles). D. C. prodr. 3. p. 131. Tube of calyx ovate, bractless; lobes 5. Connectives of anthers drawn out into a bifid spur or 2 auricles at the base. Flowers white or rose-coloured.

3 C. LANCEOLATA (D. C. l. c.) stem herbaceous, rather tetragonal, clothed with adpressed villi; leaves petiolate, broad-lanceolate, acuminate, serrately ciliated, 5-nerved, villous on both surfaces; peduncles trichotomous, axillary, and terminal; tube of calyx ovate, rather longer than the subulate lobes, which are reflexed and ciliated; connectives of anthers drawn out into a bifid spur or 2 auricles at the base. 

Lanceolate-leaved Chêtagostra. Pl. 1 to 2 feet.

4 C. LONGIFOLIA (D. C. prod. 3. p. 132.) stem herbaceous, angular, bent with adpressed pili; leaves petiolate, lanceolate, elongated, acuminate, pilose, 5-nerved; lateral nerves concrete at the base; panicle axillary, dichotomous, shorter than the leaves; tube of calyx ovate, longer than the lobes, which are subulate. 

Long-leaved Chêtagostra. Pl. 1 to 2 feet?

5 C. HAVANAJSIS (D. C. prod. 3. p. 192.) stem almost herbaceous; branches tetragonal, hairy; leaves petiolate, oval, acuminate, almost quite entire, 5-7-nerved, bent with scattered villi on both surfaces; panicles axillary, cymose, shorter than the leaves; alternate ones disposed in a panicled thyrsus; tube of calyx ovate, villous, rather longer than the lobes, which are subulate; anthers furnished with 2 tuberules at the base.

XXII. Chêtagostra.

5 S. Native about the Havannah, in Cula, where we have seen it growing in plenty, at very little distance from the town. D. C. coll. 1. t. 7. It is very nearly allied to the preceding species, but differs in the leaves being broader, cymes shorter, and in the connectives of the anthers being hardly evident.

Havana Chêtagostra. Shrub 1 to 2 feet.

6 C. SCHIEDEAena (Schlecht. et Cham. in Linnae. 5. p. 566.) suffruticosæ; branches terete, bent with adpressed hairs; leaves on short petioles, ovate-lanceolate, acuminate, 3-nerved, obsoletely serrulate, villous on both surfaces and ciliated on the margins; cymes terminal and axillary, 3-5-flowered; flowers on short pedicels; calyx strigose, campanulate, with linear-spulate segments, which are about equal in length to the petals, which are obvolute; connectives of anthers biauriculate at the base. 

6.* S. Native of Mexico, near Misanta. Flowers rose-coloured.

Var. β. macrántha (Schlecht. et Cham. in Linneæ. 5. p. 566.) flowers purple, double the size of those of the species; petals twice the length of the calycine lobes; seeds small, white, cochlate.

Schiedea's Chêtagostra. Shrub 1 to 2 feet.

7 C. HISPÌDA (D. C. l. c.) stem herbaceous, tetragonal, hispid; leaves petiolate, oval, attenuated at the base, and acuminate at the apex, 5-nerved, hardly serrulate, (lateral nerves confluent at the base,) villous above, hispid on the nerves beneath, but pubescent between the nerves; panicles lateral and terminal, disposed in a thyrsus; calyx ovate, villous, with subulate lobes; connectives of anthers very short, furnished with 2 very short tuberules at the base of each. 

7.* S. Native of Brazil. Like C. lanceolâta and C. Havanensis, and probably all three constitute but one species. Flowers white. 

Hispida Chêtagostra. Pl. 1 to 2 feet.

8 C. HYPERICOIDES (D. C. l. c.) plant erect, simple, densely clothed with canescent villi; leaves oval, on short petioles, acute, 7-nerved; pedicels axillary and terminal, leafy, loose; tube of calyx ovate, longer than the lobes; petals ovate, hardly exceeding the calycine lobes. 

St. John's-wort-like Chêtagostra. Pl. 1 to 2 feet.

9 C. LÝCHNITOIDES (D. C. l. c.) plant herbaceous, erect; stem almost simple, densely beset with spreading hairs; leaves sessile, ovate, acute, clothed with adpressed silky villi, 7-nerved, quite entire; thryse elongated; flowers bracteate, crowded on the peduncles; calyx villous, with an ovate tube, nearly twice the length of the lobes, which are lanceolate and acuminate. 

9.* S. Native of Brazil, in the province of Minas Geraes, on sandstone rocks. Rhêxâ lýchnitoidèes, Schrank et Mart. mss. Very like C. hypericoides, but differs in the calyces being twice the size, and in the flowers being more crowded. Stamens unknown. Capsule 5-celled. Seeds small, cochlate, smooth.

Lýchnitis-like Chêtagostra. Pl. 1 to 3 feet.

10 C. STACHYCOIDEÆ (D. C. l. c.) plant herbaceous, erect; branches tetragonal, hairy; leaves on short petioles, oblong, obtuse at the base, acute at the apex, quite entire, 5-nerved, clothed with adpressed villi; flowers crowded into verticillate heads in the axils of the leaves; calyx 4-5-cleft: appendages hair-formed, hardly distinct. 

10.* S. Native of Brazil. Rhêxâ stachycoideæ, Bonpl. rhex. t. 45. Flowers rose-coloured. Five of the stamens are almost without auricles at the base, and the other 5 are furnished with a long connective each which ends in 2 bristles. There is a variety of this species, according to Bonpland, with 4-5-cleft octandrous or decandrous flowers.
**MELASTOMACEÆ.**

**Stachys-like Chetogastra.** Pl. 2 feet.

**11 C. ciliata (D. C. l. c.)** stem herbaceous, tetragonal, and is as well as the petioles and peduncles hispid; leaves on short petioles, oblong, acuminate, serrulata, 5-nerved, beset with stiff villi above and densely clothed with pale soft villi beneath; cymes terminal, subcorymbose; calyx very villous, with short, lanceolate lobes; connectives of anthers bluntly baccate at the base. **2.** S. Native of Brazil, in the province of Minas Geraes, on the more elevated mountains, in fields. Rhéxia hieracioides, Mart. et Schrank, **mss.** Very like *Rhéxia pilosella* of Bonpl. but the leaves are much broader, and 5-nerved, not 7-nerved, and all parts of the plant are much more hairy, the flowers more numerous, and on shorter pedicels, and according to Schrank the petals are obovate, of pale lilac colour, not yellow, nor terminated by a hair, and in the anthers being twice the length.

**Hairy Chetogastra.** Pl. 1 foot. **2**.

**18 C. strigillosa (D. C. L. c.)** almost herbaceous, erect, densely clothed with adpressed stiff pili; leaves on short petioles, oval, acute, 5-nerved; peduncles longer than the leaves, bearing sessile flowers in the axils of the bracteas; flowers dendroides. **2.** S. Native of Brazil, in the province of Minas Geraes, on the sides of mountains. Rhéxia strigillosa, Schrank et Mart. **mss.** Stem a foot high, hardly branched. Leaves nearly 5 inches long. Flowers purple, 9-10 lines in diameter; lobes of calyx lanceolate-linear. Petals obovate, ciliated. Anthers having their connectives hardly produced under the cells, tumid, straightish, and acuminate at the base. Allied to *C. hieracioides*.

**Strigillose Chetogastra.** Pl. 1 foot.

**19 C. sheardiioides (D. C. L. c.)** plant erect, herbaceous, branched, rough from strigose adpressed short pili; leaves on very short petioles, narrow-lanceolate, quite entire, 5-nerved; flowers terminal, 3-together, or axillary and solitary, dendroides. **2.** S. Native of Peru, ex Hanke, or of Brazil, in the province of Minas Geraes, ex Mart. Rhéxia sheardiioides, Schrank **mss.** Leaves 6-7 lines long and 2-3 broad. Flowers middle-sized. Tube of calyx ovate; lobes 5, linear-subulate, elongated. Anthers linear, acuminate, drawn out at the base into a long pedicel each, which ends in 2 bristles. Style long, and is as well as the filaments glabrous.

**Sheardii-like Chetogastra.** Pl. 1/3 foot.

**Clinopodium-leaved Chetogastra.** Pl. 1/3 foot.

**21 C. mollis (D. C. L. c.)** shrubby; branches terete, clothed with soft adpressed villi; leaves petiolate, ovate, acuminate, 5-nerved, beset with soft villi; thryse panicked, terminal, crowded, hairy; tube of calyx ovate, velvety, about equal in length to the lobes, which are linear; petals ovate, acuminate mucronate; anthers almost without auricles at the base. **2.** S. Native of Peru, in groves about Loja. Rhéxia mollis, Bonpl. rhex. t. 19. Flowers of a violaceous blue colour. Ovary hairy.

**Soft Chetogastra.** Shrub 6 feet.

**22 C. cane-scent (D. C. L. c.)** shrubby; branches terete, and are as well as the leaves densely clothed with short hairs; leaves petiolate, ovate-lanceolate, 3-nerved, quite entire; flowers subterminal, usually 3 together, drooping, on short pedicels; calyx rather hairy, with an ovate tube, which is about the length of the lobes; connectives of anthers hardly evident; anthers bluntly bifurcate at the base. **2.** S. Native of cold places, on Mount Purase at Popayan, where it is called *Sarzileja.*
Rhixia carneóssus, Bonpl. rhex. t. 6. Flowers dark purple or violaceous. Calyx red.

**Cranescent Calogetastra.** Shrub 5 feet.

23 **C. sarmentóssus** (D. C. L. c.) shrubby; branches climbing almost terete, villous; leaves on short petioles, oval, somewhat cordate, serrulate, 7-nerved, villous; flowers terminal, approximating by threes, on very short pedicels; calyx villous, with the tube about equal in length to the lobes; connectives of anthers long, furnished with 2 tubercles each at the base. S. Native of Peru, in hot places near Cuenca and St. Felipe. Rhixia sarmentóssus, Bonpl. rhex. t. 10. Flowers large, of a reddish violaceous colour.

**Sarmentóssae Calogetastra.** Shrub cl.

23 **C. muricáta** (D. C. L. c.) shrubby; branches, peduncles, and calyces pilose; leaves petiolar, broadly ovate, somewhat cordate, hardly acute, 5-nerved, beset with bristles above, which are blistered at the base, but clothed with silkyomentum beneath; flowers terminal, solitary; anthers each furnished with a slender appendage, which is bidentate at the base. S. Native of cold places on Mount Purase, near Popayan. Rhixia muricáta, Bonpl. rhex. t. 1. Habit almost of *Cistus salésfólils*. Flowers large, purple, or violaceous.

**Muricáttae Calogetastra.** Shrub 4 to 5 feet.

**Stróóssae Calogetastra.** Sh. 6 to 8 feet.

26 **C. lépítóda** (D. C. L. c.) shrubby; branches bluntly tetragonal, and are, as well as the petioles, leaves, peduncles, and calyces scabrous from imbricated scaly bristles; leaves petiolar, oblone-lanceolate, 5-nerved, hardly serrulate; cyymes pedunculate, terminal; flowers few, almost sessile, crowded; calyx with an obvate tube, and obtuse lobes; connectives of anthers hardly evident, and almost without any auricles at the base. S. Native of Peru, in cold places near Jaen de Braeamoros. Rhixia lépítóda, Bonpl. rhex. t. 15. Flowers purple or violaceous. Capsule globose, bristly, and denticulate at the apex. *Lepídóttae Calogetastra.* Sh. 6 feet.

27 **C. cardínaáis** (D. C. L. c.) branchlets somewhat tetragonal, very hairy, and very leafy; leaves almost sessile, orbicularly reniform, quite entire, 5-7-nerved, strígose above, but clothed with silky hairs beneath; flowers terminal, crowded, almost sessile; calyx hispid, with a campanulate tube, rather longer than the lobes, which are bluntish; connectives of anthers hardly produced, emarginate. S. Native of Brazil, in hot places near Gran-Para. Rhixia cardínaáis, Bonpl. rhex. t. 37. Melástoma cardínaáis, Spreng. syst. 2. p. 298. Calyx coloured inside. Flowers of a rose purple-colour.

**Cardínaáis Calogetastra.** Sh. 2 to 4 feet.

28 **C. stríctá** (D. C. L. c.) branchets terete, velvety from short down; leaves on short petioles, oval-lanceolate, 3-nerved, quite entire, rather hairy; flowers nodding, bibracteate; calyx campanulate, rather villous; connectives of anthers drawn out into 2 bristles, which are capitate at the apex. S. Native of Peru, in cold places on Mount Purase, and near Loca. Rhixia strictá, Bonpl. rhex. t. 8. but not of Purush. Shrub much branched, straight. Flowers purple or violaceous. Calyces and bracteas purplish. Petals ciliated. Ovarium bristly. There is a variety of this species having 4-petalled flowers.

**Straight Calogetastra.** Sh. 4 to 5 feet.

29 **C. echiñáta** (D. C. prod. 3. p. 155.) branches terete, and are, as well as the peduncles, petioles, and calyces beset with thick adpressed stiff pili; leaves ovate, 5-nerved, woolly beneath, echinated above, quite entire; flowers inclinate; base of calyx ovate, about equal in length to the lobes, which are lanceolate; connectives of anthers thick at the base. S. Native of Peru, on the tops of hills. Rhixia echiñáta, Ruiz et Pav. fl. per. 3. p. 85. t. 319. f. 6. Flowers large, spreading, of a violaceous purple-colour. Capsule 5-celled, bristly at the apex. Seeds coelate.

**Echínáttae Calogetastra.** Sh. 2 to 3 feet.

30 **C. ceñná** (D. C. L. c.) branches tetragonal, rough at the angles; leaves on short petioles, oval, rather crenulate, 5-nerved, often hispid along the nerves; flowers pedicellate, usually 3 together, terminal, drooping; tube of calyx campanulate, one-half shorter than the lobes, which are lanceolate. S. Native of Peru, on the Andes, on Mount Purase near Popayan. Rhixia ceñná, Bonpl. rhex. t. 13. Osbéckia ceñná, Spreng. syst. 2. p. 512. Petals ovate, violaceous. Calyx violaceous. Capsule 5-celled.

**Dropping-flowered Calogetastra.** Sh. 5 to 6 feet.

**Sect. III. BRACTÉÆ'IA** (from *bractea*, a bract or prop; in reference to the flowers, which are furnished with 6 bracteas each at the base). D. C. prod. 3. p. 135. Calyx with an obvate pilose tube, girded at the base by 6 free bracteas, which are arranged in 3 series; lobes 5, obtuse. Anthers hardly biauriculate at the base.

31 **C. confré'ta** (D. C. L. c.) suffruticose, much branched; branchlets hairy; leaves on short petioles, crowded, small, oval, obtuse, 3-nerved, beset with adpressed bristles; flowers terminal, solitary, drooping; bracteas 6, involving the flower; calyx pilose, with 5 bluntish teeth. S. Native of Peru, in cold places near Loca. Rhixia confré'ta, Bonpl. rhex. t. 20. Petals roundish, violaceous, almost conniving into a tube. Capsule globose, denticulate from 5 bristle-like teeth.

**Crowded Calogetastra.** Sh. 3 feet.

**Cult.** For culture and propagation see *Lasiándra*, p. 752.

### XXXIII. ARTHROSTE'MMA

(from *aphóv*, arthron, a joint, and *stémma*, for *stérmos*, stamen, a stamen; in reference to their stamens or connectives being joined). Pav. ex D. Don, membr. soc. wern. 4. p. 298. D. C. prod. 3. p. 135.—Melánium, Rich. herb.

**LIN. SYST.** *Octándria*, *Monogynia*. Tube of calyx tubinate or campanulate, usually clothed with bristles, pili, or scales; lobes 4, lanceolate, permanent, without any appendages between them. Petals 4. Stamens 8; filaments quite glabrous. Anthers oblong, opening by one pore at the apex, furnished with longish connectives, which are biauriculated at the base. Ovary bristly at the apex. Capsule 4-celled. Seeds coelate.

—Herbs or shrubs, very variable in habit, all natives of South America. The genus is composed, as it now stands, of a heterogeneous mass of species, which may hereafter be divided into many genera, instead of sections.

**Sect. I. CHÁETHOPÉ'TALUM** (from *quárt*, chaité, a bristle, and *péralon*, petalon, a petal; in reference to the petals, which are 5 p. 2
terminated by a bristle each). D. C. prod. 3. p. 135. Petals 4, oval, each terminated by a bristle. Anthers 8, equal, having their connectives not appended. Ovary 4-toothed at the apex. Capsule 4-celled. Seeds reniform, not truly cochleate.—Hemis, suffruticose at the base. Flowers white or yellow. Perhaps this section is sufficient to form a proper genus.

1 A. angusture's (D. C. l. c.) herbaceous; leaves lanceolate, 3-nerved, quite entire, pilose on both surfaces; terminal flower, almost solitary; calyx clothed with stellate down. 2. S. Native on the banks of the Orinoco, near Angustura. Rhæxa Angusture's, Bonpl. rhex. p. 77. t. 29. Flowers yellow. Genitals hardly longer than the petals. Anthers linear, falcate.

Augústura Arthrostemma. Pl. 2 to 3 feet.

2 A. Pilolosélides (D. C. prod. 3. p. 136,) suffruticos at the base; leaves crowded at the roots, lanceolate, quite entire, 7-nerved, pilose; stem almost a scape, loosely panicled, few-flowered; calyx pilose. 2. S. Native of New Granada, in cold places at the elevation of 3000 feet. Rhæxa Pílefloséloides, Bonpl. rhex. p. 12. t. 5. Flowers yellow, spreading. Style short, rather ciliate.

Mouse-ea.r-like Arthrostemma. Pl. ¾ to ¾ foot.

Sect. II. Brachytum (from brachy, brachys, short, and oe there, aus otos, an ear; auricles of the connectives of the anthers short). D. C. prod. 3. p. 136. Calyx 4-cleft, without any appendages. Petals 4, suborbital, usually convolute. Connectives of anthers furnished with 2 short auricles each. Ovary bearing bristles at the apex, not 4-toothed. Capsule 4-celled.—Suffruticose plants.

3 A. Kosmaninfoliolum (D. C. l. c.) shrubby; branches terete, echinate; leaves nearly sessile, oblڑong-linear, 3-nerved, with revolute quite entire edges; peduncles 1-5-flowered, pendulous; calyx hispid; petals convolute. 2. S. Native of Peru, on the mountains. Rhæxa Kosmaninfoliolum, Ruiz et Pav. fl. per. 3. p. 84. t. 319. f. 2. Leaves small, firm; when in a dry state they are olive-coloured above, and yellowish below. Calyx purplish, with lanceolate teeth. Petals yellowish.

Yellowish Arthrostemma. Shrub 1 to 2 feet.

4 A. Lutcèsens (D. C. l. c.) shrubby; branches rugged, pilose; hairs thick, stiff; short; leaves ovate, 3-nerved, curved a little, white beneath; peduncles 5-flowered; calyx pilose; petals convolute. 2. S. Native of Peru, on the mountains. Rhæxa Lutcèsens, Ruiz et Pav. fl. per. 3. p. 84. t. 319. f. 2. Leaves small, firm; when in a dry state they are olive-coloured above, and yellowish below. Calyx purplish, with lanceolate teeth. Petals yellowish.

Yellowish Arthrostemma. Sh. 2 feet.

5 A. Quiñéenêtre (D. C. l. c.) shrubby, much branched; branches tetragonal, beset with adpressed bristles; leaves petio- late, ovate, acute, quite entire, 5-nerved, bristles above, but villous tomentose beneath; peduncles axillary and terminal, many-flowered, indented at the apex; flowers drooping; calyx bristly, with an ovate tube, shorter than the lobes, which are sebaceous. 2. S. Native of Peru, on the mountains and hills. Rhæxa Quiñéenêtre, Ruiz et Pav. fl. per. 3. p. 85. t. 321. f. 3. Petals almost commingling into a tube, ciliated. Connectives of anthers furnished each with 2 very short auricles. Capsule 4-valved, bristly at the apex. Style excised.

Five-nerved-leaved Arthrostemma. Sh. 6 feet.

6 A. Campanula're (D. C. l. c.) shrubby; branches clothed with rufous down; leaves ovate, 5-nerved, quite entire, very hispid above, but tomentose beneath; flowers drooping, campanulate, calyx pilose. 2. S. Native of Peru, in cold places near Loxa, at the elevation of 3000 feet. Rhæxa Campanulàris, Bonpl. rhex. p. 85. t. 14. Petals deep purple or violaceous, awned. Style thickened at the apex. Capsule globose. This plant appears to be intermediate between the first and the present section.

Campanulate-flowered Arthrostemma. Sh. 4 feet.

Sect. III. Ladanóopsis (from ladánum, the ladanum bush, and o'psis, resemblance; plants with the habit of Cistus ladanifera or ladanum-tree). D. C. prod. 3. p. 136. Calyx 4-cleft. Petals 4, obovate, expanded. Connectives of anthers rather long, furnished with two short auricles at the base of each. Capsule 4-celled, bristly at the apex. Seeds cochleate.—Hemis, or subshrubs.

7 A. Ladanóisides (C. l. c.) plant herbaceous, erect; hairs or strigillate on the stems and leaves adpressed, but those on the calyx are spreading, and in fascicles; stem tetragonal; leaves on short petioles, lanceolate, acuminate, ovate at the base, 3-nerved, serrulate; pedicels elongated, loose, axillary, 1-flowered, and terminal 3-flowered; tube of calyx ovate, longer than the lobes, which are oblong and ciliated. 2. S. Native of Brazil and Guiana, in marshes. Rhæxa hísipa, Rich. in act. soc. hist. nat. par. 1791. p. 108. Rhæxa ladanóides, Rich. in Bonpl. rhex. t. 27. Rhæxa ða, Mart. herb. Melastóma trichotómum, Willd. ined. ex herb. mus. par. Anthers oval, truncate, short, rather dissimilar, especially 4, having short connectives, and 4 with longer ones. Ovarium bristly, 4-celled. Seed cochleate. Flowers purplish.

Ladanum-like Arthrostemma. Pl. 1 to ¼ foot.

A. Herbécaum (D. C. prod. 3. p. 137,) herbaceous; stem tetragonal, covered with minute hairs; leaves on short petioles, ovate-lanceolate, acuminate, crenulated serratulate, villous above, but clothed with hairyomentum beneath; cymes on long peduncles, axillary, 3-flowered; calyx villous, with 4 ovate ciliated lobes; anthers rather dissimilar. 2. S. Native of Brazil, in woods, in the province of Rio Janeiro and Minas Geraes, but rare. Rhæxa herbéca, Schrank et Mart. moss. Petiole hairy. Petals obovate-oblong, when young ciliated at the apex. Anthers 8 oblong, with smooth beaks, the 4 longest having straight connectives, and the 4 shortest arched ones.

Herbaceous Arthrostemma. Pl. 1 foot.

9 A. Hib'sut'sium (D. C. l. c.) herbaceous, erect; stem tetragonal, very hairy from long, rather bristly, spreading, somewhat retrogade hairs; leaves on short petioles, lanceolate, acuminate, crenulated serratulate, densely clothed with adpressed villi; cymes on long peduncles, axillary, 3-flowered; calyx villous, with 4 ciliated lobes; anthers dissimilar. 2. S. Native of Brazil. Very like A. herbécaum, but differs in the hairiness. Ovarium bristly at the apex. Seeds cochleate.

Very-hairy Arthrostemma. Pl. 1 foot.

10 A. Martúsia'num (D. C. l. c.) stem erect, hairy, almost herbaceous, oppositely and paniculately branched; branches quadrangular; leaves on short petioles, ovate-lanceolate, acute, serrulate, 5-nerved, beset with adpressed stripe above, but with soft villi beneath; peduncles dichotomous, 3-7-flowered. 2. S. Native of Para, in Brazil. Rhæxa paniculàta, Mart. herb. and Schrank, moss. but not Hamilt. Rhæxa Martúsiana, Ser. moss. Rhæxa cerasifólia, Schrank, et Mart. moss. Tube of calyx ovate, rather pilose; lobes 4, acute. Petals ovate, purple, pilose on the back. Anthers articulated at the base; the articulation distant from the cells, and tupid on one side. Ovarium bristly at the apex.

Martus's Arthrostemma. Pl. 1 to 2 feet.

11 A. Polýgonoídes (D. C. l. c.) suffruticos? branches loose, tetragonal, beset with a few slender adpressed bristles; leaves on short petioles, oblong, quite entire, 3-nerved, beset with adpressed bristles on both surfaces; flowers axillary, solitary, almost sessile; lobes of calyx 4, rarely 5, longer than the
tube, ovate-lanceolate, each terminating in a hair. Fl. S. Native of Brazil, in marshy fields in the province of Minas Geraes. Rhinia, polygala, Mart. herb. Very like A. pur-nilum. Leaves terminating in a long hair. Hair on the calyx simple, and adpressed. Petals small, white. Ovarium briskly at the apex.—Bonpl. rhx. t. 55. f. 4.

Polygonum-like Arthrostemma. Pl. 1 to 2 feet.

12 A. villiösa (D. C. l. c.) suffruticosum, decumbent, hairy in every part; branches tetragonal; leaves on short petioles, oval, denticulate, 5-nerved; flowers few, almost sessile at the tops of the branches; calyx with an ovate tube, and 4 lobes, which are subulate at the apex; connectives of anthers furnished with 2 horns each. Fl. S. Native of Cayenne, at Aroura in sandy meadows. Rhöxia villosa, Aubl. guian. p. 334. t. 129. f. 1.

Petals convex, violaceous. Capsule 4-celled.

Villos Arthrostemma. Pl. decumbent.

13 A. Aurelèthi (D. C. l. c.) suffruticosum, decumbent, hairy in every part; branches tetragonal; leaves on short petioles, roundish, acute, serrulate, 5-nerved; flowers solitary, terminal; tube of calyx globose; lobes subulate at the apex; connectives of anthers furnished with 2 horns at the base. Fl. S. Native of Guiana, in sandy meadows at Aroura. Rhöxia lateriflória, Aubl. guian. t. 129. f. 2. Very like the preceding species, but differs in every part, being twice the size.

Aublet's Arthrostemma. Shrub decumbent.

15 A. nummularioidés (D. C. l. c.) shrubby, much branched, clothed with minute down; leaves petiolate, nearly orbicular, cordate, crenulate, 5-nerved, rather tomentose beneath; flowers solitary, on the tops of the axillary branches; connectives of anthers drawn out each into 2 blunt appendages, or one bident one. Fl. S. Native near Esmeraldas, on the Orinoco. Rhöxia nummularioides, Bonpl. rhx. p. 2. p. 23. Flowers rose-coloured. Perhaps this species belongs to a different section.

Money-wort-like Arthrostemma. Shrub decumbent.

16 A. cilátum (Pav. ex D. Don, mem. soc. wern. 4. p. 299.) stem herbaceous, quadrangular; leaves cordate, smooth on both surfaces, serrulate and ciliated on the margins; appendages of anthers tridentate at the base. Fl. S. Native of Peru. Ciliated-leaved Arthrostemma. Pl. 2 to 3 feet.

17 A. leviflórum (D. Don, l. c.) stem shrubby; leaves broad, ovate, acuminate, serrulate and ciliated; panicle large; appendages of anthers of 3 bristles. Fl. S. Native of French Guiana.

Broad-leaved Arthrostemma. Shrub.

18 A. monocátum (from monos, monos, one, and chaite, a bristle; in reference to the appendages of anthers being drawn out into a single or emarginate spur at the base). D. C. prod. 3. p. 138. Calyx 4-cleft. Petals 4. Connectives of anthers drawn out each into one simple or emarginate ascending spur, or in a bristle at the same base. Perhaps this section is sufficient to constitute a distinct genus.

19 A. calcărátum (D. C. l. c.) shrubby; branches somewhat tetragonal, smoothish, bearing whorls of bristles at the knots; leaves petiolate, oblong, acuminate, 3-nerved, ciliate, sessile, with a few bristles beneath; flowers pedicellate, solitary, or by threes at the tops of the branches; calyx beset with adpressed bristles; with 4 lanceolate, somewhat coloured, ciliate lobes; anthers with long beaks, ending in a long slender spur at the base. Fl. S. Native of Mexico. Flowers purple, like those of a species of Lasiandra, but differs in the petals being 4, and in the stamens being glabrous. Ovarium densely beset with bristles.

20 A. spửaed-anthered Arthrostemma. Sh. 1 to 2 feet.

21 A. Deppeana (Schlecht. et Cham. in Linnae. 5. p. 566.) suffruticosum, much branched; branches terete, beset with adpressed hairs; leaves narrow-lanceolate, bluntish, triple-nerved, quite entire, stigose on the nerves on the under surface, and between the nerves on the upper surface, and on the margins; flowers terminal, solitary; tube of calyx turbinate, stigose; calycine segments lanceolate, acute; petals roundish, ovate; connectives of anthers drawn out into a simple ascending spur. Fl. S. Native of Mexico, at San Andres and on Cerro Colorado. Flowers purple.

22 A. Myrtoidéum (D. C. l. c.) suffruticosum; branches clothed with powdery down; leaves oblong, quite entire, glabrous, triple-nerved, white beneath, perhaps from down; flowers axillary and solitary, or terminal and tern; tube of calyx turbinate, glabrous; spurs of anthers long, nearly terete. Fl. S. Native of Mexico, near Quarecato; and near Santa Fe de Bogota. Rhöxia myrtoides, Bonpl. rhx. t. 3. Petals violaceous, oval-lanceolate. Adult branches glabrous, with separable bark. Ovarium downy at the apex from minute stellate down.

Myrtle-like Arthrostemma. Sh. 2 feet.

23 A. Bonaflándii (D. C. l. c.) suffruticosum; branches densely clothed with short down; leaves on short petioles, ovate, 5-nerved, quite entire, villous on both surfaces from soft down, canescent beneath; flowers pedicellate, 1-3-together, axillary, or terminal, and tube of calyx ovate, longer than the lobes. Fl. S. Native of South America, on the banks of the river Amazon. Rhöxia canescens, Bonpl. rhx. p. 14. t. 18. Rhöxia Bonplândii, Kunth, ined. Rhöxia incaica, Spreng. syst. 2. p. 309. Flowers violaceous.

24 A. Bónoplándii (D. C. l. c.) suffruticosum; branches densely clothed with short down; leaves on short petioles, ovate, 5-nerved, quite entire, villous on both surfaces from soft down, canescent beneath; flowers pedicellate, 1-3-together, axillary, or terminal, and tube of calyx ovate, longer than the lobes. Fl. S. Native of Peru, in woods. Rhöxia dicrananthera, Ruiz et Pav. fl. per. 3. p. 84. t. 320. f. a. Arthr. multiflorum, D. Don, in mem. wern. soc. 4. p. 299. Ovarium pilose at the apex. Seeds cochleate.

Two-headed-anthered Arthrostemma. Sh. 1 to 2 feet.

25 A. lineátum (D. Don, l. c.) stem shrubby, pilose; leaves lanceolate, quite entire, with hairy lines on both surfaces. Fl. S. Native of Peru. The rest unknown.

Lined-leaved Arthrostemma. Shrub.

26 A. multiflorum (D. C. l. c.) suffruticosum, branched at the base; leaves on short petioles, lanceolate, 5-7-nerved, quite entire; villous; thryse panicked, terminal, many-flowered; appendages of anthers bristle-formed, rising from the base. Fl. S. Native on the banks of the Orinoco, in humid shady places. Rhöxia multiflóra, Bonpl. rhx. t. 16. Oseóckia Bónoplândiana, Spreng. syst. 2. p. 313. Flowers rose-coloured.
Many-flowered Arthrostemma. Sh. 3 feet.
Cult. The shrubby species of this genus should be cultivated and propagated in the manner of the species of Melastomina, p. 764. The annual species in the manner of those of Centradenia, p. 766.

Lin. syst. Octo-Deckandra, Monogynia. Tube of calyx ovate, usually clothed with stellate bristles or down; lobes 4-5, permanent or deciduous; bearing appendages between the lobes on the outside of various sizes and forms. Petals 4-5. Stemmen 8-10; filaments glabrous; anthers nearly equal, terminating in short beck's, and having their connectives furnished with 2 short auricles at the base. Ovary bristly at the apex. Capsule 4-5-celled. Seeds cochlolate. Herbs, but usually subshrubs, natives of America, Africa, and Asia. Leaves quite entire, 3-5-nerved. Flowers terminal. This genus is perhaps divisible in several genera instead of sections.

Sect. I. Microlepis (from micros, mikros, small, and lepis, a scale; so named on account of the small scale-like appendages between the lobes of the calyx). D. C. prod. 3. p. 139. Tube of calyx ovate-oblong, ureculate, and constricted at the apex; limb 5-cleft; teeth deciduous. Stemmen 10. Appendages between the lobes of the calyx small and ciliated. Species all South American.

1 O. urecula (D. C. prod. 3. p. 139.) plant almost herbaceous; stems tetragonal; leaves petiolate, oval, quite entire, 5-nerved, cloathed with villous tomentum on both surfaces; panicles terminal and axillary; calyx 5-toothed, with an ovate tube, which is constricted under the teeth; appendages between the teeth of the calyx long and lacerately ciliated; petals ciliated. ɣ. S. Native of Brazil, near Rio Janeiro. Rhéxia urecularia, Schrank et Mart. msx. Petioles 6 lines long. Leaves 4 inches long. Petals purple. Anthers linear-falcate, beaked, length of filaments: having their connectives short, and tumid at the articulation. Seeds cochlolate, truncate at the base, striated longitudinally.

Ureculate-calyx Osbeckia. Pl. 1 foot.

2 O. jucunda (D. C. l. c.) shrub: glabrous; branches terete; leaves petiolate, ovate-lanceolate, acuminate, quite entire, 3-nerved, or somewhat 5-nerved; petiole terminal; peduncles and calyxes clothed with furfuraceous down; tube of calyx ureculate; petals oblong. ɣ. S. Native of Brazil, in shady woods near Almada, in the province of Bahia. Rhéxia jucunda, Schrank et Mart. msx. Leaves 6-7 inches long, and 2 broad. Petals white, 3 or 4 times longer than the calycine teeth. Stemmen 10; filaments bluish. Anthers yellow, elongated, with short beaks: 5 of which have their connectives drawn out into a little lateral sack, and those of the other 5 are not drawn out. Pleasant Osbeckia. Shrub 1 to 2 feet.

3 O. pytrophyllya (D. C. l. c.) shrub; leaves on very short petioles, oblong-ovate, acuminate, 3-nerved, glabrous above and shining, with impressed veins, clothed with white tomentum beneath, as well as on the calyxes; cymes few-flowered, terminal; lobes of calyx acute, 3 times shorter than the ovate tube; petals acuminate. ɣ. S. Native of Brazil, on high dry mountains, in the province of Minas Geraes. Rhéxia pytrophyllya, Mart. herb. Rhéxia acuminate, Schrank, msx. Shrub branched; branches tetragonal, with separable bark. Leaves 10 lines long. Anthers falcate, without any beak. Style very long. Ovarium beset with small bristles at the apex. Appendages of calyx small. Tomentum velvety. Fruit and seeds unknown.

Scurfy-leaved Osbeckia. Sh. 1 to 2 feet.

4 O. olearifolia (D. C. l. c.) subfurfuraceous; branches hardly tetragonal, clothed with powdery tomentum; leaves petiolate, oblong-lanceolate, quite entire, 3-nerved, clothed with white velvety tomentum beneath, glabrous above; thyrsle terminal; bracts hiding the calyx when young; calyx velvety from small stellate down: lobes or teeth 5 or 6, short, oblong; anthers rather dissimilar. ɣ. S. Native of Brazil, in the province of St. Paul, in elevated dry fields. Rhéxia olearifolia, Schrank et Mart. msx. Petals purple, minutely ciliated. Anthers linear, falcate, long, beaked: having their connectives drawn out into a ligula each, which are sometimes bifurcate, and sometimes somewhat 2-lobed. Leaves 15-20 lines long, and 6-7 broad.

Var. β. quaternifolia (D. C. l. c.) young branches tetragonal, furfuraceous, and bearing glandular pili; leaves on short petioles, 3 or 4 in a whorl, oblong, blunt at the base, and acute at the apex, 5-nerved, minutely dotted above, but clothed with white furfuraceous velvety down beneath. ɣ. S. Native of Brazil, in the province of Minas Geraes, at the sides of woods. Rhéxia quaternifolia, Schrank et Mart. msx. Petals purple, obovate-oblong. Anthers long, linear, falcate, beaked: 5 of which have forked connectives. Ovarium bristly at the apex. Down on calyx stellate.

Olecol-leaved Osbeckia. Sh. 1 to 2 feet.

Sect. II. Cлитo-lepis (from χώρα, χώτε, a bristle, and λείπης, a scale; there are stiff bristles between the lobes of the calyx, which hold the place of the appendages). D. C. prod. 3. p. 140. Lobes of calyx 4, with as many stiff simple bristles between the lobes on the outside, holding the place of appendages.

—American plants.

5 O. microphylla (D. C. l. c.) shrub: much branched; branches terete, scabrous from stigmas; leaves on short petioles, ovate, quite entire, 5-nerved, scabrous on both surfaces from adpressed stigmas, pale beneath; flowers solitary, subcorymbose, pedicellate; tube of calyx ovate, bristly at the apex; ovary furnished with 8 bristles at the apex. ɣ. S. Native of Guadalupe, on the mountains; and near Santa Fe de Bogota. Rhéxia microphylla, Bonpl. rhex. t. 2. Flowers yellow. Anthers obtuse. Petals obovate. Lobes of calyx, as well as the appendages, permanent.

Small-leaved Osbeckia. Sh. 1 foot.

Sect. III. Ptero-lepis (from πτερος, pteros, a wing, and λείπης, a scale; in reference to the appendages between the lobes of the calyx being pectinated). D. C. prod. 3. p. 140. Stemmen 8-10. Calyx 4-5-cleft; lobes permanent, with the appendages between the lobes elongated and pectinated.—American plants.

* Flowers 5-cleft, decandrous.

6 O. parrissifolia (D. C. prod. 3. p. 140.) shrub: clothed in every part with silky villi; branches terete; leaves sessile, orbicular, rather cordate at the base, quite entire, 5-nerved; flowers almost sessile, axillary, usually solitary, but sometimes terminal and aggregate; calyx very hairy, with villous bristle-formed appendages between the lobes, and 3 ciliated coloured lobes. ɣ. S. Native of Brazil, in stony grassy places, in the province of Bahia. Rhéxia parrissifolia, Mart. et Schrank, msx. Lobes of calyx purplish, linear-oblong. Petals purple, obovate-cuneate. Style a little longer than the calyx. Stamens unknown. Young leaves mucronate. Capsule 1-5-celled. Seeds cochlolate.

Parrissia-leaved Osbeckia. Shrub.

7 O. striphnonocalyx (D. C. l. c.) shrub: branches nearly terete, and are, as well as the peduncles and under side of the
leaves, scabrous from adpressed bristles; leaves petiolate, elliptic-oblong, acuminate, quite entire, 3-nerved, glabrous above, and with oblique stripes between the nerves; pinnate terminal; calyx very hairy; bristles palmately stellate; anthers 5. 7. S. Native of Brazil, in the province of Rio Negro. Rhéxia striphocalyx, Mart. herb. Anthers linear, beaked, 3 times the length of the connectives, which are drawn out into one or two small lobules at the base. Calyx clothed with long white hairs. Stipules between the nerves of the leaves very evident. Flowers purple.

**Hairy-calyx** Osbeckia. Shrub.

8 O. Smíth (D. C. L. c.) branches tetragonal, hispid; leaves on short petioles, oblong-elliptic, 3-nerved, ciliated on the nerves and margins; flowers terminal, aggregate; appendages of calyx bristle-formed. 7. S. Native of the Mauritius, but probably cultivated there. Melastoma Osbeckioides, Sims, bot. mag. 2235. Flowers large, purple. Perhaps the same as Osbeckia Chinensis, Lin.

9 O. Prínceps (D. C. L. c.) branches angular, and are, as well as the leaves, clothed with fuscous tomentum beneath; leaves petiolate, oblong, rather cordate at the base, sharply serrated, 7-nerved, unequal, strigose on the upper surface; coryms terminal; hairs on calyx glandular; appendages of calyx ending in a stellate tuft of hairs. 7. S. Native of Brazil. Rhéxia Princeps, Bonpl. rhex. t. 45. Flowers large, purple, composed of 5 petals according to the description, but only of 4 according to the figure.

*Princeps'*s Osbeckia. Sh. 3 to 4 feet.

**Flowers 4-cleft, octandrous.**

10 O. alpéstris (D. C. L. c.) shrubby, beset in every part with somewhat adpressed strigose pill; leaves on short petioles, ovate, acute, quite entire, nerveless; flowers almost sessile, disposed in a terminal head; calyx very villous. 7. S. Native of Brazil, on the Alps of Serro Frio and Itambe. Rhéxia semi-adnata, Schrak, mss. Rhéxia alpéstris, Mart. herb. Leaves 6 lines long and 4 broad; petioles thick, semilandate. Lobes of calyx lanceolate, glabrous inside. Petals violaceous, minutely ciliated. Anthers falcate, wrinkled transversely, with short beaks; having their connectives not drawn out beyond the articulation.

*Alp* Osbeckia. Sh. 1 to 2 feet.

11 O. repán'da (D. C. prod. 3. p. 141.) herbaceous; stem nearly terete, and is, as well as the peduncles and leaves, villous from adpressed strigae; leaves petiolate, lanceolate, 3-nerved, quite entire, acute; peduncles elongated, dichotomous; calyx very strigose, with the lobes acuminated and ciliated at the base, and having the scales or appendages between the lobes percipitated; petals somewhat repandly truneate at the apex. 2. S. Native of Brazil, in elevated fields, in the province of Minas Geraes. Rhéxia repánda, Mart. et Schrak, mss. Petals purpure. Anthers linear-falcate, acuminated by the beaks, twice the length of their connectives, which are hardly tumbil at the base. *Habit of Arthrostemma grináci*es. *Repand-leaved* Osbeckia. Pl. 1 to 2 feet.

12 O. glomerá'ta (D. C. prod. 3. p. 141.) herbaceous; branches nearly tetragonal, scabrous from adpressed bristles; leaves on short petioles, ovate-lanceolate, acuminated, 3-nerved, clothed with adpressed stiff hairs; flowers axillary, usually solitary, but capitulate at the tops of the branches; tube of calyx beset with branched stellate pill, ovate: with its scales ciliate percipitated, elongated and distant, and with its lobes ciliated, stiff, and lanceolate. 2. S. Native of Maríninque, Trinidad, Surinam, and Brazil. Hook. bot. mag. 2838. Rhéxia glomeráta, Rothb. sur. 8. t. 46. Rhéxia capitáta, Rich. in Bonpl. melas. 2. t. 32. Petals rose-coloured, ovate, hardly longer than the lobes of the calyx, minutely ciliate. Connectives furnished with 2 tubercles at the base of each.

13 O. spán'koideés (D. C. L. c.) shrubby, very hairy all over; leaves sessile, oval-oblong, acute, 3-nerved, terminated by a bristle; flowers sessile in the axis of the upper leaves, and somewhat aggregate at the tops of the branches; calyx hispid from palmate bristles, having its lobes terminating in a hair, and the appendages long, and ending in a palmate tuft of bristles at the apex. 7. S. Native of Brazil. Rhéxia spán'koideés, Mart. herb. Habit almost of *Cheetogastra lychnitoides*, but the characters are very different.

*Spanen-like* Osbeckia. Sh. 1 to 2 feet.

14 O. bracteólát*is (D. C. L. c.) shrubby; leaves on short petioles, oblong, 3-nerved, quite entire, villously pubescent above, but clothed with velvety tomentum beneath, reteculated; peduncles axillary, dichotomous, bracteolate; flowers octandrous; calyces, branches, and peduncles densely clothed with glandular hairs; lobes of calyx linear, about equal in length to the tube, which is ovate. 7. S. Native of Brazil, in elevated fields, in the province of Minas Geraes. Rhéxia bracteólatinás, Schrak et Mart, mss. Calyx nearly as in *Osbeckia Chinénsis*, apparently 8-cleft from the intervening scales. Anthers elongated, falcate, beakless. Seeds coelebic, hairy, truncate at the base. Ovarium 4-toothed at the apex, hardly bristly.

*Bracteolate* Osbeckia. Sh. 2 to 3 feet.

15 O. pu'míla (D. C. L. c.) herbaceous, rather pilose; leaves ovate-lanceolate, entire, 3-nerved; flowers axillary and terminal, solitary, almost sessile; calyx clothed with stellate hairs, with the lobes acute, and shorter than the tube, and having the appendages ending in a stellate tuft of hairs at the apex.—Native country unknown. Rhéxia pú'míla, Bonpl. rhex. t. 35. without a description. Flowers according to the figure small, and pale purple. Connectives of anthers bluntly bicurlicated at the base. Ovarium bristly at the apex. Calyx beset with scattered pill, which are stellate at the apex.

*Dwarf* Osbeckia. Pl. ½ foot.

**Sect. IV. Osbeckiáea** (in alternation from the generic name). D. C. prod. 3. p. 141. Calyx 4-5-cleft, ornamented with bristles on the tube, which are palmate from the base: with the appendages between the lobes plumose, but usually percipitated; the lobes fall off along with the appendages, leaving the mouth of the calyx truncate, or as if it was cut round.—All natives of Asia.

16 O. Chím'énès (Lin. spec. p. 490.) nearly herbaceous; stems 4-winged; leaves almost sessile, lanceolate-oblong, 3-nerved, rather hispid, a little crenulated; flowers cymose, terminal, few; calyx hemispherical, with 4-5 acute, linear-acute, bristly, deciduous lobes. 7. G. Native of China. Ker. bot. mag. t. 542. Petals obovate, acuminated, purple, longer than the stamens. Anthers rather falcate. Style filiform, incurved at the apex. Capsule roundish, white, 5-seeded. Perhaps *O. Simiáis*, no. 8 is the same.

17 O. Zeylla'nicá (Lin. fil. suppl. p. 215.) suffruticose; branches tetragonal, beset with adpressed bristles; leaves ovate-lanceolate, rather reflexed, 3-nerved, nearly sessile, strigose; flowers nearly sessile, usually 3-together; calyx tubular, with 4 ovate-oblong lobes; ovary crowned by 16-20 bristles. 7. S. Native of Ceylon, Amboyna, and Manila. Lam. ill. t. 283. f. a. 1. Ker. bot. reg. t. 565. O. Chím'énsis, Gértn. fract. 2. p. 292. —Pluk. alm. t. 173. f. 4. Calycine scales radiating into ciliate,
nearly the length of the tube. Petals 4, obovate, somewhat
truncately acuminate, rose-coloured, largish. Stamens 8.

Style a little curved. Capsule elliptic, 4-5-celled.

18 O. *angustifolia* (D. Don, prod. fl. nep. p. 221.) stem her-
baceous, straight, tetragonal, beset with adpressed stigiae; leaves
ovate-lanceolate, tapering to the apex, 3-nerved, beset with ad-
pressed bristles; flowers bracteate, aggregate into terminal few-
flowered heads; calyx tubular, glabrous, with 4 oval-oblong lobes,
having the appendages between the lobes ending in a palma
tuft of bristles; ovarium crowned by 8 bristles.  "S. Native of
Nipaul. Wall. pl. asiat. rar. 3. p. 53. t. 251. O. ciliaris and O.
tennis Hamilt. herb. Flowers purple. Anthers 8, furnished with
a long slender beak. Very nearly allied to *O. nipaulensis,*
*Narrow-leaved* Osbeckia. Pl. 2 to 3 feet.

19 O. *linearis* (Blum, in bot. zeit. 1831. no. 27. p. 473.)
plant herbaceous, beset with short stipigo bristles; branches
tetragonal; leaves sessile, linear-lanceolate, 3-nerved; heads
terminal, few-flowered, bracteate; calyx furnished with 5 ap-
pendages at the throat, terminating in palmate bristles; calyx-
cine segments ovate-oblong, acute, ciliated; ovary crowned
by numerous bristles.  "S. Native of Java, near Batavia,
in humid places; also of the Moluccas. Tristémmia angusti-
folia, Blum. biur. p. 1079.

*Linear-leaved* Osbeckia. Pl. 1 to 2 feet.

20 O. *nipaulensis* (Hook, exot. fl. t. 31.) suffruticose;
branches somewhat tetragonal, rough from short adpressed bristles;
leaves sessile, ovating-lanceolate, beset with short, ad-
pressed hairs, 5-nerved; flowers bracteate, in fascicles; scales
of calyx broad and palmately ciliated; calyxine lobes deci-
duous, length of the tube, which is obovate.  "G. Native of
Nipaul. O. speciosa, D. Don, prod. fl. nep. p. 222. Petals
5, obovate, violaceous. Anthers 10, somewhat falcate, undu-
lated. Fruit 5-celled, truncate, naked from the scales being
deciduous.

*Var. β, albilósa* (Lindl. bot. reg. 1475.) flowers white.  "S.
Native of Nipaul.

21 O. *stellata* (D. Don, in bot. reg. t. 674, and prod. fl.
ep. p. 221.) suffruticose; branches rough from adpressed hairs;
leaves petiolar, ovate-lanceolate, acuminate, 5-nerved, beset
with short, ovate-lanceolate scales; flowers glabrescent, tube
of calyx elongated, urceolate, covered with stellate plumose scales.
"S. Native of Nipaul. Petals 4, obovate, violaceous. Anther
8, yellow, falcate, long. Style deflexed. Capsule 4-
celled, inclosed in the truncate, elongated calyx. Seeds scab-

*Var. β; scales of calyx palmately ciliated, and more distant.

22 O. *ternifólia* (D. Don, in prod. fl. nep. 221.) shrubby;
branches trigonal, furnished with rough bristles; leaves oppo-
site, but usually 3 in a whorl, and sometimes even 4, almost
sessile, lanceolate, acuminate, 5-nerved, beset with minute
bristles along the margins and the nerves; racemes disposed in
a terminal panicle; bracteae coriaceous; calyx urceolate, beset
with ciliately pectinated scales, which with length fall off and the
calyx becomes in consequence naked; lobes of calyx lanceo-
late-linear, acute, histerid, deciduous.  "S. Native of Nipaul.
Wall. pl. asiat. rar. t. 5. p. 21. t. 240. Calyx almost like that
of O. stellátum. Flowers large, purple. Anthers 8, yellow.

*Tern-leaved* Osbeckia. Shrub 2 to 4 feet.

23 O. *leschenaultiána* (D. Don, prod. fl. p. 142.) shrubby;
branches tetragonal, beset with stiff pili; leaves sessile, ovate,
acutish, approximate, 5-nerved, villous on both surfaces; flowers
sessile, bracteate, in heads, usually of three; tube of calyx
globose, with the scales palmately ciliated, and the lobes 4 and
lanceolate.  "G. Native of the East Indies, on the Nellig-
gherry mountains, where it is called *Taberi-Guida.* Leaves
hardly an inch long. Stamens 8.

*Leschenaultiána* Osbeckia. Shrub 3 to 4 feet.

24 O. *manillána* (D. C. L. c.) suffruticose; branches te-
tragonal, and are as well as the petioles hispid; leaves petiolar,
ovate, acuminate, 5-nerved, somewhat ciliately serrated, and
with a few scattered hairs on both surfaces, pale beneath;
flowers terminal, and in the forks of the branches, 3-5 in a
fascicle; tube of calyx beset with long stellate hairs; having
the lobes and appendages deciduous.  "G. Native of Ma-
nila, one of the Philippine Islands. Flowers large, purple,
almost like those of a species *Lastindra.*

*Manilla Osbeckia.* Shrub 6 to 8 feet.

25 O. *aspera* (Blum. in bot. zeit. 1831. no. 27. p. 474.)
shrubby, rough from short stipigo bristles; branches obscurely
tetragonal; leaves on short petioles, oblong-obovate, or oblong-
lanceolate, acute, obtuse at the base, 3-nerved; flowers decan-
drous, on short pedicels, terminal, subbracteose; calyx clothed
with adpressed down, furnished with subulate, minute appen-
dages at the throat; calyxine segments ovate-oblong, obtuse;
ovary rather downy.  "G. Native of Ceylon. Melastoma

*Rough* Osbeckia. Shrub 3 to 4 feet.

26 O. *repens* (D. Don. prod. fl. 3. p. 142.) stem suffruticose,
branched, creeping at the base, tetragonal at the apex, gla-
brous; leaves petiolate, roundish-obovate, somewhat cuneated
at the base, 3-5-nerved, glabrous, almost quite entire; flowers
terminal, solitary, on short pedicels; tube of calyx beset with
chaffy bristles; lobes 4-7, lanceolate: with the appendages between
the lobes spiny-ciliated.  "G. Native of China. Melastoma
repens, Desrous, in Lam. dict. 4. p. 54. Rhéenia heteran-
thera, Bonpl. rhex. t. 23. Flowers rose-coloured. Capsule 5-
celled. Habit of *Córuma Canadensis.*

*Creeping* Osbeckia. Shrub creeping.

27 O. *octándra* (D. Don. prod. fl. 3. p. 142.) stems suffruticose,
glabrous, but beset with adpressed bristles at the tops, creeping
at the base; leaves petiolar, ovate, 3-5-nerved besides the 2
marginal nerves, glabrous, except the margins and the nerves
on the under surface, which are beset with adpressed bristles;
flowers urceolate, terminal, on short pedicels; tube of calyx
ovate, ciliately fimbriate from bristles.  "G. Native of Ceylon.
like O. *repens,* but differs in the leaves being not cuneated at
the base.

*Ocandras* Osbeckia. Shrub 1 foot.

28 O. *chuleís* (D. Don, prod. fl. nep. p. 221.) shrubby;
branches lepidotized; leaves oval-oblong, mucronulate, 5-nerved,
cordate at the base, pilose and rough on both surfaces, canes-
cent beneath; flowers corymbose; scales on calyx membranous,
ciliated with bristles, scattered: segments ovate-oblong and ciliated.
"G. Native of Nipaul, at Narainhetty. Melastoma
chuleís, Hamilt. mss. Leaves 3 inches long and an
inch or an inch and a half broad. Flowers large, pale purple,
5-cleft, at first bracteate by broad membranous scales.

*Chuleís* Osbeckia. Fl. June, Shrub 2 to 3 feet.

29 O. *rostrástá* (D. Don, prod. fl. nep. p. 221.) leaves lan-
colate, acute, somewhat 5-nerved, rounded at the base, nakedish
on both surfaces, green; flowers corymbose; bracteae coriace-
corlate; calyx oblong, furnished with numerous scattered bristly
scales; the lobes oblong-lanceolate and ciliated.  "G. Native
of Nipaul, at Narainhetty. Melastoma rostrastá, Hamilt. mss.
Flowers purple, 4-cleft.

*Beaked* Osbeckia. Shrub 2 to 3 feet.

*Cul.* All the species of *Osbeckia* are worth cultivating for
the beauty of their flowers. Their culture and propagation is the same as that for the species of Melastoma, p. 764.

Lin. syst. Decandra, Monogynia. Tube of calyx turbinate, clothed with imbricate scales; pierced at the base by a double involucrum, both formed of 2 conic bracteas; lobes 5-lanceolate, without any appendages between the lobes, as in Osbéckia. Petals 5, oval. Stamens 10; filaments ciliate, connectives of anthers bluntedly bicinate at the base. Ovarium free, bristly at the apex. Capsule dehiscent. Seeds coccolate.

—A shrub, native of Guiana. Branches slightly tetragon, purple, as are also the pedicels scabrous from scales. Leaves short petioles, ovate, blunt at the base and acute at the apex, quite entire, 5-nerved, clothed with stiffish hairs beneath, and adpressed vili above, which is confluent between the nerves. Flowers few, nearly terminal, girded by a double involucrum.

Rough Tibouchina. Shrubs 2 to 3 feet. Cult. For culture and propagation, see Melastoma, p. 764.

XXXVI. TRISTEMMA (from rīvea, three, and aστυμα, stoma, a crown; in reference to the calyx being girded by 3 circles of bristles). Juss. gen. p. 329. D. C. prod. 3. p. 144.

Lin. syst. Octo-Decandra, Monogynia. Calyx tubular, 4-5-cleft, furnished with margins or beaded appendages near the limb, and surrounded by many bracteas at the base. Petals 4-5, unequal. Stamens 8-10; anthers a little arched, somewhat auriculatum at the base. Ovarium hardly adnate to the calyx at the base, and crowned by stiff hairs at the apex. Berry variously depressed, 4-5-celled, clothed by the calyx. Seeds unknown. Subspirae or herbs, with tetragon stem. Leaves 3-5-nerved. Flowers capitate. This genus appears to be intermediate between Osbéckia and Melastoma.

1 T. vires'sanum (Comm. miss. ex Juss. l. c.) stem suffruticos; leaves ovate, acuminate, 5-nerved, pilose on both surfaces as well as the branches; heads of flowers terminal, almost sessile, usually composed of 5-8 flowers. Fl. S. Native of the Mauritius. Vent. choix. t. 35. Tristemma Mauritianum, Pers. ench. 1. p. 476. Melastoma virusánæ, D. Don, in werd. soc. mem. 4. p. 396. Calyx girded by 3 rings of bristles. Flowers purple.

Poisonous Tristemma. Shrub 1 foot. 2 T. ni'rum (Vent. choix. t. 35, in a note) stem herbaeae, tetragonal, branches and petioles beset with spreading stiff hairs; leaves ovate, 5-nerved, acuminate; flowers capitatum, terminal, sessile, bracteatum. Fl. S. Native of Guiana, in the kingdom of Waree. Beav. fl. d'ow. vol. 1. p. 93. t. 57., with a figure. Very like T. vires'sanum, but differs in the stems being herbaceous, and in the hairs being longer and more patent. Calyx having only 2 circles of bristles. Flowers red. Hairy Tristemma. Pl. 1 foot. Cult. For culture and propagation, see Melastoma, p. 764.

XXXVII. SARCO'PYRAMUS (σαρ'κός, flesh, and πυραμις, pyramid; in allusion to the herb, which is fleshy and pyramidal in its growth). Wall. tent. fl. nep. 1. p. 32. t. 23. D. C. prod. 3. p. 485.

Lin. syst. Octantria, Monogynia. Calyx adhering to the ovary at the base, semigland, obversely pyramidal, with a truncate 4-toothed border; teeth compressed, ciliate, having the interstices naked. Petals oval, acute. Stamens 5. Anthers simple, straight, naked, opening by 2 pores at the apex. Ovarium semi-adnate to the calyx, with a funnel-shaped, 4-lobed apex. Capsule square, 4-winged at the apex, 4-celled, 4-valved; valves dilated and obovate. Seeds cuneate and triangular.

—A fleshy erect herb. Leaves petiolate, oval, acute, 3-nerved, with entire margins, those opposite each other unequal in size. Flowers rose-coloured, in cyms. This genus differs from others in a remarkable degree, in the fruit being capsular, and in the ovary being semi-adnate at the same time.

1 S. Nipuléinis (Wall. l. c. t. 23.). Fl. S. Native of Nipaul, in moist stony valleys, among the mountains.

Nipaul Sarco'pyramus. Pl. 1 foot. Cult. For culture and propagation, see Centradenia, p. 766.

XXXVIII. MELASTOMA (from μελας, melas, black, and μονος, stoma, the mouth; the berries of some of the species are black: they are commonly eaten by children, whose mouths the fruit stains black). Burm. fl. ind. D. C. prod. 3. p. 144.—Melastoma species of Lin. gen. 544. D. Don, in werd. soc. mem. 4. p. 286.

Lin. syst. Deca-Dodecandra, Monogynia. Tube of calyx ovate, half adhering to the ovary, densely covered with scales or bristles; limbs 5 (5111. a.), rarely 6-cleft; the segments alternating with the appendages, both deciduous. Petals 5 (5111. a). Stamens twice the number of the petals. Anthers oblong-linear, a little arched, opening by a pore at the apex, each furnished with a stipel-formed connective, which is in some species elongated, and in others short, but always biciliate or emarginate in front. Free part of ovary conical and bristly. Style filiform, somewhat thickened at the apex. Stigma a pruinose dot. Capsule baccate, 5-6-celled opening irregularly. Seeds coccolate.

—Shrubs, usually covered with strige. Leaves petiolate, quite entire, or serrulate, nerved. Peduncles terminal, disposed in fascicles or pinnate-corymbs, sometimes solitary; pedicels bristle. Flowers large, white, rose-coloured, or purple. The genus differs from Osbéckia in the fruit being hardly dry, not opening regularly at the cells, but fleshy at the base and opening in an irregular transverse manner.

* Fruit baccate. 1 M. denti'cula'tum (Labill. caled. l. p. 65. t. 64.) shrubby; branches a little compressed, and are as well as the petioles scabrous from adpressed bristles; leaves petiolate, oval-oblong, acuminate, 3-nerved, scabrous from small bristles above, pale beneath, and beset with adpressed strige along the nerves; flowers few, in a kind of cyme; calyx urceolate, clothed with adpressed strige, with the lobes lanceolate and deciduous. Fl. S. Native of New Caledonia. Ovarium bristly at the apex. Seeds coccolate. Flowers white?

Denticulate-leaved Melastoma. Shrub 3 to 4 feet. 2 M. Tait'ia'ne (D. C. prod. 3. p. 144.) shrubby; branches tetragonal, and are as well as the petioles rough from strige; leaves petiolate, oval-oblong, acuminate, rather denticulate, 3-nerved, besides the 2 marginal nervules, scabrous from bristles on the upper surface, but striose on the nerves beneath; coryps few-flowered; calyx scabrous from thick strige; lobes 5, oblong, deciduous. Fl. S. G. Native of the Island of Taiti, in the South Sea. Allied to M. denti'cula'tum, but differs in the corolla being of 5, not of 6 petals, and in the leaves being 3-nerved, not 5-nerved. Flowers white. Berry 5-celled. Seeds coccolate.
MELASTOMACEÆ.  XXXVIII. MELASTOMA.

Tait Melastoma.  Shrub 3 to 6 feet.

3 M. affinis (D. Don, in mem. wern. soc. 4. p. 288.) shrubby; branches scaly; leaves lanceolate, acute, 3-nerved, pilose on both surfaces; flowers usually 3 together; calyx densely clothed with scales.  ʃ. S. Native of the East Indies and the Straits of Sunda.  Very like the preceding and following species, and probably only a variety of one or the other; from the following it differs in the leaves being longer and narrower, 3-nerved, and more rough.

Allied Melastoma.  Shrub 4 to 6 feet.

4 M. Malabaricum (Linn. spec. p. 559.) shrubby; branches tetragonal, rough from stigmas; leaves elliptic-oblong, obtuse at the base, acute at the apex, quite entire, green on both surfaces, and scabrous from stigmas; corollas 1-5-flowered; calyx clothed with adpressed stigmas; leaves with ovate, acute lobes; alternate stamens barbed, according to Blume; connectives of the anthers short or very long.  ʃ. S. Native of the East Indies; frequent in the Indian Archipelago.—Rheed. maj. 4. t. 42.—Rumph. amb. 4. t. 72.  Flowers large, purple.

5 M. erectum (Jack, in Lin. trans. 14. p. 5.) shrubby; branches terete, or obscurely tetragonal; leaves ovate, 3-nerved, acute at both ends, villous; flowers corollas; terminal, few; bractlets small; calyx scabrous from long, erect pili, with linear deciduous segments; fruit 5-celled.  ʃ. S. Native of Sumatra and Java.  Petals large, purple.  Probably distinct from M. Malabaricum, according to Blume, bijdr. p. 1076.

Erect Melastoma.  Shrub 6 to 8 feet.

6 M. cannabina (D. Don, in mem. soc. wern. 4. p. 228.) shrubby; branches scaly; leaves oval, acute, 7-nerved, densely clothed with silky white down on both surfaces; calyx covered with soft, white, linear-elongated, adpressed scales.  ʃ. S. Native of China and the Straits of Sunda.  Flowers purple.

7 M. macrocarpum (D. Don, in mem. soc. wern. 4. p. 289.) shrubby; branches nearly terete, clothed with adpressed stiff hairs, as well as the petioles; leaves ovate-oblong, acuminate, 5-nerved, quite entire, green on both surfaces, scabrous from scattered bristles above, as well as on the nerves beneath, and between them puberulous; flowers terminal, usually solitary; calyx roundish, densely clothed with long stiff hairs; stamens alternate, dissimilar.  ʃ. G. Native of China.  Melastoma Malabaricum, Sims, bot. mag. t. 529.  D. Don, in bot. reg. t. 672.  Flowers large, reddish purple.

8 M. malouinum (D. Don, l. c.) shrubby; branches terete, very rough from red bristles; leaves on short petioles, ovate-lanceolate, acuminate, 5-nerved, green above and shining, but red at the nerves beneath and on the petioles; flowers few, terminal; calyx covered with very long incurved bristles; petals 6, large.  ʃ. S. Native of the Straits of Sunda.  Sims, bot. mag. 2241.  Flowers large, white.  Very like M. macrocarpum.

9 M. folialem (Blume, in bot. zeit. 1813. no. 28.) branches, petioles, and under side of leaves rough on the nerves, from little scales; leaves elliptic or ovate-oblong, acute at both ends or obtuse at the base, quite entire, 3-nerved, besides 2 little marginal nervules, scabrous from stigmas, but clothed with silky pubescence beneath; flowers 7-11 or more, disposed in a corollas; calyx covered with adpressed, scale-like stigmas; having short, triangular, ovate, acute segments; each of the alternate stamens has its connective elongated.  ʃ. S. Native of Java and Sumatra in bushy places.  M. Malabathricum, Jack, in Lin. trans. 14. p. 4.  Blume. bijdr. p. 1070.—Rumph. amb. 4. t. 72.  Flowers purple.

Var. β; scales of the calyx spreading.

Var. γ; leaves on short petioles; flowers smaller, white; segments of the calyx bluish.

Many-flowered Melastoma.  Shrub 4 to 6 feet.

10 M. Tidorensis (Blume. l. c. p. 482.) branches, petioles, and nerves on the under surface of the leaves rough from scaly stigmas; leaves ovate-oblong, acuminate, rounded at the base or obtuse, denticulated, rough from stigmas, but very hairy beneath, 5-nerved; flowers subcorollas; terminal; calyx beset with adpressed bristles: with broad, subulate segments; each alternate stamen has its connective elongated.  ʃ. S. Native of the Moluccas, on the top of Mount Tidor.  M. Malabathricum, Reinw. ined.  Flowers purple.

Tidore Melastoma.  Shrub 4 to 6 feet.

11 M. Roteensis (Blume. l. c. p. 483.) branches, petioles, and nerves on the under surface, rough from little scales; leaves lanceolate or ovate-lanceolate, acuminate at both ends or bluish at the base, slightly denticulated, 5-nerved, as well as having 2 marginal, hardly distinct nervules, rough from stigmas; flowers 5-7, disposed in a terminal kind of corollas; calyx beset with scale-like stigmas; having short, broad-subulate segments; each alternate stamen has its connective elongated.  ʃ. S. Native of Java, in woods on the higher mountains.  M. Malabathricum, flore albo, Reinw. ined.  Flowers white.  Stamens all equal and fertile.

Rough Melastoma.  Shrub 4 to 6 feet.

12 M. appetum (Blume, bijdr. p. 1076. but not of Lin.) branches, petioles, and nerves of leaves on the under surface, rough from little scales; leaves ovate-oblong, acuminate, obtuse at the base, quite entire, sub-5-nerved, rough from stigmas; flowers 3-7, in a terminal fascicle; calyx beset with adpressed, scale-like stigmas, with linear elongated segments; stamens equal, each with an elongated connective.  ʃ. S. Native of Java, in woods on the higher mountains.  M. Malabathricum, flore albo, Reinw. ined.  Flowers white.  Stamens all equal and fertile.

Wood Melastoma.  Shrub 4 to 6 feet.

13 M. sylvaticum (Blume. bijdr. p. 1077.) branches, petioles, and nerves of leaves on the under surface, rough from little scales; leaves elliptic-oblong, acuminate, acute at the base, quite entire, 5-nerved, scabrous; flowers 3-5, in terminal fascicles; calyx beset with scale-like stigmas; with linear elongated segments; stamens equal, each having a short connective.  ʃ. S. Native of Java, where it is called Harendong-Gumun.  Flowers whitish.  Stamens 16, yellowish:

Var. β, uniflorum (Blume. l. c. in bot. zeit. 428.) stems decumbent, rooting; leaves smaller; flowers terminal, solitary.

Var. γ, Native of Java, in the province of Bantam.

Wood Melastoma.  Shrub 4 to 6 feet.

14 M. setigerum (Blume. bijdr. p. 1077.) branches, petioles, and nerves on the under surface of the leaves, thickly beset with chaffy bristles; leaves ovate-oblong, acuminate, rounded at the base, 5-nerved, brightly above, roughish and hairy beneath.  ʃ. S. Native of Java, on Mount Salak.

Var. β, angustiflora (Blume. in bot. zeit. 1831. no. 28.) leaves ovate-oblong, rounded at the base, nearly 5-nerved; flowers in terminal corollas; bracteas linear, acuminate; calyx...
MELASTOMACEÆ.

XXXVIII. MELASTOMA.

M. cyanoëides (Smith, in Rees. cycl. vol. 23.) leaves ovate, acute, entire, 5-nerved, beset with yellowish bristles; racemes terminal, forked; calyx densely clothed with bristles; bracteas oval, fringed. Φ. S. Native of Amboyna. Rumpl. Jamb. 4. t. 71.—Rheed. mal. 4. t. 43. ex Smith.

Cyana-leaf Melastoma. Shrub 3 to 6 feet.

M. dodecandrum (Lour. coch. p. 274.) shrubby; leaves ovate, quite entire, glabrous, 5-nerved; peduncles few-flowered, terminal; flowers dodecandrous, rose-coloured; larger stamens have their connectives elongated, in the smaller ones the connectives are hardly evident, all fertile; berry roundish, 5-celled. Φ. G. Native of Cochin-China and China, about Canton. M. rosea, Poir. dict. suppl. 3. p. 644. Flowers red.

Dodecandrous Melastoma. Shrub 1 foot.

M. obvolute (Jack. in Lin. trans. 14. p. 3.) shrubby; branches tetragonal, scaly; leaves ovate, 5-nerved, clothed with adpressed pili; flowers few, in terminal panicles; bracteas ovate, involving the calyx; calyx covered with stellate pili; anthers of longer stamens furnished with 2 appendages at the base; ovaryum 5-celled. Φ. S. Native of Sumatra. Limb of calyx crowned by long scales on the outside. Flowers purple.

Obvolute-calyxed Melastoma. Shrub 2 feet.

M. septemnervium (Lour. p. 273.) shrubby; branches terete; leaves oval-lanceolate, quite entire, 7-nerved, pilose on both surfaces, scabrous, petiolate; flowers few, terminal, large, purple, decandrous; calyx 5-cleft; petals roundish; stamens brown, refracted, furnished with a long tail each; berry ovate, hispid, dry, 5-celled. Φ. G. Native of Cochin-china, every where on the less cultivated hills and fields. Flowers purple.

Seven-nerved-leaved Melastoma. Shrub 6 feet.

M. madagascariensis (D. Don, mem. wern. soc. 4. p. 290.) leaves elliptic, 3-nerved, mucronate, acute at the base, beset with stiff hairs beneath as well as the branches; flowers panicled; calyx hispid; anthers furnished with long connectives, each ending in 2 bristles. Φ. S. Native of Madagascar. Madagascar Melastoma. Shrub.

* * Species natives of Sierra Leone, with dry capsules.

M. cymosum (D. C. prod. 3. p. 147.) stem branched, blunted tetragonal, warted, pubescent; leaves cordate, acuminate, petiolate, serrulate, 7-nerved; flowers cymose; calyx campanulate; with its teeth triangular, and one-half shorter than the tube; petals obovate, somewhat laterally acuminate, purple or red; genitils deflexed; larger stamens falcate, purple, each furnished with a prominent connective, which is broadest at the base and somewhat truncatezely emarginate at the apex; style filiform; capsule 3-celled, 5-valved. Φ. S. Native of Sierra Leone, Veres. hort. transm. t. 14. Lois. hort. amat. t. 135. ex Balb. Sims, bot. mag. 984. Flowers purple.

Cymose-flowered Melastoma. Shrub 2 feet.

M. plumosus (D. Don, l. c.) herbaceous, erect; stem branched; branches quadrangular; leaves roundish-ovate, entire, acute, 3-nerved, pilose on both surfaces as well as the branches; flowers scattered, solitary, on the tops of the branches and branchlets; calyx beset with scales, which are stellately plumose at the apex. Φ. S. Native of Sierra Leone, on the mountains, particularly in the coffee plantations near the Governor's house. Osbeckia rotundifolia, Smith, in Rees' cycl. vol. 25.

Plumose-scaled Melastoma. Pl. 4 foot.

M. involucratum (D. Don, l. c. but not of Desr. nor Schrank, nor Mart.) the whole plant beset with stiff pili; stems and branches red; branches diffuse; leaves elliptic, or ovate-lanceolate, acute, oblongately 5-nerved, quite entire; flowers few
together, sessile, terminal, glomerated, involucrated by lanceolate bracteas; calyx pilose, with the segments lanceolate and acuminated. \( t \). S. Native of Sierra Leone, on the banks of rivulets, in shady places. Petals red. Anthers yellow. Flowers 3-5 in each cluster.

**Involucrated-flowered Melastoma.** Shrub 1 to 2 feet.

29 M. *AZELIA* (D. Don, l. c.) the whole plant beset with short stiff hairs; branches erect and furrowed; leaves ovate, acuminated, 5-nerved as well as with 2 marginal nervules; flowers secund, terminal, racemose or panicled; calyx covered with bristles, which are usually disposed in stellate fascicles, with the segments linear and plumose at the apex. \( t \). S. Native of Sierra Leone, by the sides of rivulets, in shady places. Osléčka Aželjána, Smith, in Rees' cycl. vol. 25.

**Aželija's Melastoma.** Shrub 1 to 2 feet.

30 M. *ALBIFLÓRUM*; shrubby, branched; rather pilose; stems and branches quadrangular; leaves elliptic, acute, 5-nerved, beset with short pilon on both surfaces, purplish beneath; flowers in terminal, crowded heads; calyx glabrous. \( t \). S. Native of Sierra Leone. Petals white; anthers yellow. The calyx very smooth, that is, without any bristles or scales; it is therefore doubtful whether it is a true species of *Melastoma*.

**White-flowered Melastoma.** Shrub 2 to 3 feet.

31 M. *CAPITÁTUM*; shrubby, branched; branches quadrangular, pilose; leaves ovate, acute, quite entire, 5-nerved, pilose, yellowish beneath; calyx glabrous, nerved; flowers sessile, disposed in crowded heads. \( t \). S. Native of Sierra Leone. Petals red. Anthers yellow. Calyx smooth, like last species.

**Capitate-flowered Melastoma.** Shrub 1 to 2 feet.

32 M. *TELLÍFÓLUM*; shrubby, erect, branched; branches quadrangular; leaves small, oval-lanceolate, acute, quite entire, sessile, 3-nerved; flowers terminal, disposed in crowded heads. \( t \). S. Native of Sierra Leone, in the low lands, common. Calyx smooth, like the 2 last species.

**Tea-leaved Melastoma.** Shrub 5 to 10 feet.

33 M. *ELONGATUM* (D. Don, l. c.) the whole plant beset with stiff hairs; root black, tuberous; tubers numerous from the same neck, fusiform; stems herbaceous, quadrangular, erect, simple, several from the same root; leaves small, elliptic, acute, entire, 3-nerved, as well as with 2 lateral nervules; flowers panicled; peduncles axillary and terminal, few-flowered; calyx oblong, clothed with scales on the outside, which are terminated by a tuft of hair at the apex; having the segments oblong and membranous, bristly at the apex. \( t \). S. Native of Sierra Leone, plentiful in the low lands about Freetown, among grass, flowering in great abundance in March and April. Nothing can exceed the beauty of this plant when in flower, in its natural place of growth; the flowers are large and vary from blue to purple and white. Osléčka grandifólia, Až. miss. Smith, in Rees' cycl. vol. 25.

**Elongated-peduncled Melastoma.** Fl. March, April. Cited 1822. Pk. 1 to 1 1/4 foot.

34 M. *DEUDEMENS* (Béuv. fl. d'ow. l. p. 69. t. 61.) stem decumbent at the base, tetragonal; leaves ovate-lanceolate, 5-nerved, besides the lateral nervules, petiolate serrated; flowers solitary, terminal. \( t \). S. Native of the western coast of Africa, on the banks of the river Formosa, in humid parts of woods. Flowers large, rose-coloured. Anthers 10, bicostose under the anthers. Capsule 5-celled.

**Decumbent Melastoma.** Shrub dee.

**Cult.** All the species of *Melastoma* are very showy when in flower. A mixture of loam, peat, and sand suits them best; and young cuttings root readily, if planted in pots filled with peat, and placed in heat, with a hand-glass over them.

**Lin. syst. Decándria, Monogénia.** Tube of calyx ovate, half adhering to the ovarium, beset with palmately cleft scales; limb 5-cleft, deciduous. Petals 3, obovate. Stamens 10, equal. Anthers oblong-linear, a little arched, attenuated upwards and opening by 1 pore, but biciliate in front at the base; their connectives indistinct. Free part of ovarium conical and bristly. Style filiform. Stigma a pruinose dot. Berry pulpy, 5-celled. Seeds coelocarp.—A shrub with terete, glabrous branches, outer branches rather tetragonal; petals and nerves of leaves on the under surface beset with scattered, addressed bristles. Leaves elliptic-lanceolate, acuminated, almost quite entire, 5-nerved, membranous, roughish, pale green, but with the nerves blushed on the under surface. Panicle terminal, trifid, or trichotomous; branches usually 3-flowered. Flowers small, white, lateral ones bipticrate, middle one on a short pedicel, braceless.

1 O. *Molucca* (Blum. l. c. p. 489.). \( t \). S. Native of Ambonya. Melastoma Molucca, Blum. bijdr. p. 1078.—Rumph. amb. t. 71. middle figure.

*Melocca Otanthera.* Shrub 1 to 2 feet.

**Cult.** See *Melastoma* for culture and propagation, p. 764.

**XL. LACHNOPSIS** (from λαχνή, lachne, down, and ποὺς πόδος, *pous polos*, a foot; in reference to the filaments or footstalks of the anthers being girded by a crown of hairs at the base). Blum. in bot. zcit. 1831. no. 27. p. 477. in a note.—Melastoma species, Link. et Otto.

**Lin. syst. Decándria, Monogénia.** Tube of calyx ovate-oblong, adhering to the ovarium; limb 5-cleft, with the segments linearly oblimate. Petals 5, ovate-oblong, obtuse. Stamens 10, equal; filaments girded by a crown of hairs at the base. Anthers oblong, beaked. Style filiform; stigma small, obuse. Capsule 5-celled, crowned by the calycine segments. Seeds coelocarp? This genus comes very near *Pleroma* and *Lasiandra*.

1 L. *rubro-lineárum* (Blum. l. c.) branches terete, clothed with rufescent stiff hairs; leaves opposite, petiolate, cordate-oblong, acuminated, denteicately crenated, 5-nerved, wrinkled, beset with rufous pili; flowers cymose, axillary, contracted; bracteae obsolete; calyx margined with red in the adult state. \( t \). S. Native of the East Indies. Melastoma rubro-limbátum, Link. et Otto, abb. t. 41. Flowers white.

**Red-limbed-calyx Lachnopsis.** Shrub 4 to 6 feet.

**Cult.** For culture and propagation, see *Melastoma*, p. 764.

**XLI. PLERÓMA** (from πληρωμά, *plerōma*, fulness; *cellof capsule*). D. Don, wern. soc. 4. p. 293. exclusive of *Lasiandra* of D. C. prod. 3. p. 151.

**Lin. syst. Decándria, Monogénia.** Tube of calyx ovate, when young often involved in 2 deciduous bracteas; lobes 5, deciduous. Petals 5, obovate. Stamens with glabrous filaments; anthers nearly equal, elongated, arched at the base, each furnished with a stipe-formed connate, which is biciliate at the base. Ovary adnate to the calyx, briskly at the apex; stigma a pruinose dot. Capsule baccate, 5-celled. Seeds coelocarp.—American shrubs, with the habit of *Lasiandra*, but differs in the filaments being glabrous, not villous, and in the ovary being adnate to the calyx, not free. Capsule baccate, not dry.

1 P. *ledufolium* (D. C. prod. 3. p. 151.) branches nearly terete, villous from stiltish somewhat adpressed hairs beneath; leaves ovate-oblong, obuse at the base, acutish at the apex, scabrous from scattered bristles above, 3-nerved, with revolute edges; pedicels axillary, 1-flowered, length of petioles; brac-

**MELASTOMACEÆ. XII. PLEROMA. XII. DIPLOSTEGIUM. XLIII. ACIOTIS. XLIV. CENTRADEIA.**

Ovarium in Native For Native S. p. 264.

**Pleuróma.**

1. **Lacteate Pleuróma.** Shrub 2 to 3 feet.

2. **P. lacteum** (D. C. l. c.) branches nearly terete, and are as well as the petioles beset with spreading bristles; leaves ovate, rather cordate, ending in a short acumens, ciliately serrated, beset with scattered nearly adpressed bristles on the upper surface, but villously-tomentose beneath; peduncles nearly opposite, axillary, long, bifid at the apex; branches 3-flowered; calyx very villous. \( \gamma \). S. Native of Peru. Melastoma laticilia, Desr. in Lam. dict. 4. p. 48. Tube of calyx beset with adpressed bristles; lobes 5, obtuse. Petals purple, ciliolate. Stamens with smooth filaments. Free part of ovary conical, rather bristly.

**Leedum-leaved Pleuróma.** Shrub.

3. **P. leedum** (D. C. l. c.) branches from compressed to tetragonal, rather hispid; petioles hispid from villi; leaves ovate-oblong, acuminate at both ends, 3-nerved, somewhat dentilicate, hardly pubescent above, pale beneath, and clothed with adpressed bristles, especially on the nerves; flowers solitary in the axils of the upper leaves, and on the tops of the branches, pedicellate; bracteas 2, ovate, involving the calyx, which is bristly. \( \gamma \). S. Native of Brazil. Habit of *Lasianthus*, but differs from that genus, in the stamens being glabrous, and in the ovary being adnate to the calyx.

**Hairly-petioled Pleuróma.** Sh. 4 to 6 feet.

4. **P. villosa** (D. Don, in mem. soc. wern. 4. p. 293.) leaves ovate-lanceolate, acute, pilose, and are as well as the branches scabrous, but canescent beneath; calyx covered with glandular hairs; having the segments lanceolate and mucronate. \( \gamma \). S. Native of Brazil. Melastoma villosa, in bot. reg. t. 664. Spreng. syst. 2. p. 302. Flowers purple. Filaments smooth.

**Tiggy Pleuróma.** Fl. Ju. 1812. Sh. 6 feet.

5. **P. heteromalla** (D. Don, l. c.) leaves oval, cordate, and petiole, beset with fleshy wool beneath; calycine segments oblong-oblong, obtuse; petals acute. \( \gamma \). S. Native of Brazil. Melastoma heteromalla, Don, in bot. reg. t. 644. Sims, bot. mag. 2337. Filaments short, glabrous, connivent. Anthers arched at the base. Petals 5-6, purplish violet. Calyx pubescent; teeth deciduous.

6. **P. villosum** (D. C. prod. 3. p. 152.) branches terete, and are, as well as the leaves, villous beneath; leaves ovate, acute, quite entire, villous, 5-nerved; flowers terminal, few, pubescence; petals obovate, retuse, mucronate; stamens 5 fertile and 5 sterile. \( \gamma \). S. Native of South America. Melastoma villosum, Sims, bot. mag. t. 262. Lodd. bot. cab. t. 553. but not of Aubl. Filaments glabrous.

**Villosum Pleuróma.** Fl. May, Ju. Ct. 1820. Sh. 3 to 4 ft.

**Diffusum Pleuróma.** Sh. decumbent.

8. **P. Mexicana** (D. C. prod. 3. p. 152.) stem erect, branched, pilose; leaves lanceolate, acuminate, 3-nerved, pilose on both surfaces; flowers 1-2, axillary or terminal; calyx pilose, with linear acute segments. \( \gamma \). S. Native of Mexico.
Unequal-sided-leaved Centradenia. Pl. 1 to 1\frac{1}{2} foot.

Cult. The seeds of this plant require to be sown in a hot-bed; and when the plant have attained the height of 2 or 3 inches, they may be potted off into separate pots, and again returned to the hot-bed; and when they begin to come into flower, they may be removed to the stove.

Tribe IV.

MICONIEÆ (this tribe contains plants agreeing with Micónia in important characters). D. C. prod. 3. p. 152. Anthers opening by 1 or 2 pores at the apex. Ovarium adnate to the calyx. Fruit baccate. Seeds not coelolate.

XLV. ROUSSEAUXIA (dedicated by De Candolle to — Desrousseaux, coadjutor with Lamarek in his Dictionnaire de Botanique). D. C. prod. 3. p. 152.

Lin. syst. Octandria, Monogyinia. Tube of calyx hemispherical, smooth; lobes 4, broad. Petals 4, obovate. Stamens 8; anthers oblong-linear, opening by 1 pore? sometimes all fertile, with their connectives rather gibbous at the base; sometimes the alternate ones are sterile, having their connectives short; and the others fertile, with long connectives, which are furnished with 2 bristles at the base. Ovarium adnate to the calyx, bearing 4 bristle-like scales at the base around the origin of the style. Style filiform. Capsule baccate, opening at the apex. Seeds angular, shining. —Shrubs, natives of Madagascar. Leaves petiolate, 3-nerved, quite entire, oval-oblong. Gynoecium trichotomous, terminal.

§ 1. Stamens equal, all fertile, each furnished with a short connective.

1 R. chrysophylla (D. C. prod. 3. p. 153.) young branches bluntly tetragonal, at length glabrous, rather blistly at the apex; leaves petiolate, oval-oblong, acute, 3-nerved, glabrous on both surfaces, beset with adpressed setae on the nerves beneath, and on the margins, which are entire; cymes terminal, twice trifid; tube of calyx campanulate, quite smooth: with 4 broad-lanceolate lobes, which are ciliated with bristles. ±. S. Native of Madagascar. Melastoma chrysophylla, Desr. in Lam. dict. 4. p. 38, but not of Rich. Leaves yellowish when dried. Petals 5, obovate. Flower-bud conical, acute. Stamens 8, equal; filaments glabrous. Anthers oblong-linear, bluntest. Ovarium crowned by 4 spiny-ciliated scales. Style filiform, rising between the scales. Fruit unknown.

Golden-leaved Rousseauxia. Shrub.

§ 2. Stamens alternately unequal; fertile ones furnished each with a long connective, which ends in 2 bristles.

2 R. articulata (D. C. l. c.) branches bluntly tetragonal, at length terete, knotted at the insertion of the leaves, roughish from rather adpressed scattered bristles; leaves petiolate, oval-oblong, acuminated, quite entire, 3-nerved, glabrous above, blistly beneath, but especially on the nerves; cymes trichotomous; tube of calyx hemispherical, glabrous, with 4 broad obtuse lobes; ovarium blistly at the apex. ±. S. Native of Madagascar, ex herb. Juss. not of Cayme, as mentioned by Desrousseaux. Melastoma articulata, Desr. in Lam. dict. 4. p. 56. Capsule adnate to the calyx, opening at the apex. Seeds angular, shining. Style filiform. Filaments glabrous, filiform. Anthers linear, opening by one pore, rather shorter than their connectives.

Articulated-stamened Rousseauxia. Shrub.

Cult. See Melastoma for culture and propagation. p. 764.

Lin. syst. Octo-Decandria, Monogyinia. Tube of calyx ovate, urceolate, almost bottle-shaped, drawn out beyond the ovarium; lobes disposed in two rows, with 4-6 outer subulate ones, and 6 inner oval membranous ones, in front of the outer ones. Petals 4-6, linear-lanceolate. Stamens 8-12. Anthers linear, hardly auricled at the base. Style filiform, exerted, hairy at the base. Stigma dot-formed. Berry dry, 3-4-celled. Seeds angular, somewhat ovate and shining, with a linear hynum. —Brazilian shrubs, more or less rough from villi or setae. Leaves triple-nerved, ciliately-serrate. Flowers capitate, usually bracteate.

Sect. I. Leandra (an alteration from the generic name). D. C. prod. 3. p. 153. Calyx 5-6-cleft; lobes disposed in two series. Hairs of the calyx and bracteae bristly.

1 L. amplexicaulis (D. C. l. c.) branches tetraconical, rough from bristles, as well as both surfaces of the leaves and margins; leaves ovate-oblong, acuminated, triple-nerved, quite entire, sessile, or coriaceous and stem-clasping at the base; heads of flowers bracteate; bracteas obtuse or emarginate. ±. S. Native of Brazil, at the river Xipote. L. hispida, Schrank et Mart. thick, 4-6 outer ones subulate and thick, and the 6 inner ones oval and rather membranous. Seeds angular, shining, with a linear hynum. Stamens not seen.

Stem-clasping-leaved Leandra. Sh. 2 to 3 feet.

2 L. paulina (D. C. l. c.) branches terete, thickly beset with rufous villi; leaves on very short petioles, broadly ovate, blistly coriaceous at the base, acute at the apex, somewhat denticulately serrate, quintuple-nerved, very villous on both surfaces; heads of flowers dense, hairy, almost sessile along the short rachis; calyx very villous; inner lobes of calyx linear and glabrous, outer ones lanceolate and villous on the outside. ±. S. Native of Brazil, in woods on the mountains between Rio Janeiro and St. Paul. Melastoma Paulinum, Schrank et Mart. mss. Upper leaves hispid from hairs, which are somewhat bulbous at the base, but clothed with villous tomentum beneath. Bracteas very villous on the outside, and smooth inside.

St. Pauli Leandra. Sh. 2 to 3 feet.

3 L. umbellata (D. C. l. c.) branches terete, and are, as well as the petioles, densely clothed with velvety down; leaves petiolate, ovate, acuminated, serrately ciliated, 7-nerved, clothed with velvety down on both surfaces; flowers in dense umbellate heads; bracteas oblong; calyx beset with glandular hairs, 6-obed, bearing 6 appendages on the outside similar to the lobes. ±. S. Native of Brazil, in woods, in the low lands in the province of Minas Geraes. Melastoma umbellatam, Schrank et Mart. mss. Petioles 14 lines long. Leaves 2-8 inches long, Peduncles and calyx thickly beset with capitate hairs. Lobes of calyx length of the tube. Petals linear, acute. Anthers linear, falcate. Connectives short. Genitalis exserted.

Umbellate-flowered Leandra. Sh. 2 to 3 feet.

4 L. involucrata (D. C. prod. 3. p. 154.) branches terete, and are, as well as the petioles, densely clothed with short velvety down; leaves petiolate, ovate, acuminated, serrately ciliated, 7-nerved, clothed with velvety down on both surfaces; flowers in dense heads; bracteas ovate; heads disposed in a terminal panicle, like those of the preceding species; calyx covered with glandular hairs, appendiculated with 5 lobes on the outside of the inner ones. ±. S. Native of Brazil, in woods. Melastoma involucratum, Schrank et Mart. mss. Perhaps the same as L. umbellata, but the bracteas are broader at the apex; tube of calyx a little longer, lobes shorter, petals narrower, and the style is hairy at the base.

Involucrated Leandra. Sh. 2 to 3 feet.

5 L. sericea (D. C. l. c.) branches terete, and are, as well as
Native leaves. Calyx tubes and petals, densely clothed with rusty villi; leaves oblong-lanceolate, acuminate, ciliately serrated, quinquelobate, scabrous from bristles above, but clothed with silky soft villi beneath; internal nerves distant from the margin of the leaf; racemes terminal, very villous; leaves on short peduncles; bracteae concave, ovate. \( \textbf{H.} \) S. Native of Brazil, in the province of Rio Janeiro. Osbeckia Brasili, Schrank, herb. \( \textbf{L.} \) \( \textbf{Raddi} \) \( \textbf{v.} \) Mart. herb. Petals lanceolate. Tube of calyx very villous; lobes double, outer ones tooth-formed, inner ones ovate.

**Silky Leandra.** Shrub 3 to 6 feet.

6 \( \textbf{L. villósa} \) (D. C. l. c.) branches terete, and are, as well as the peduncles and pedicels, densely clothed with short hairs; leaves petiolate, elliptic-oblong, acuminate, attenuated at the base, quinquelobate; (lateral nerves approximating the margin) denticulated, scabrous above from short scattered bristles, which are bivalent at the base, villous beneath, and rather feathery; flowers in dense heads; the heads disposed in a thyrse; bracteas glabrous on the outside; inner lobes of calyx membranous, exceeding the outer ones. \( \textbf{H.} \) S. Native of Brazil, at Rio Janeiro. Intermediate between \( \textbf{L. sericea} \) and \( \textbf{L. scabra} \).

**Villous Leandra.** Shrub 3 to 6 feet.

7 \( \textbf{L. scabra} \) (D. C. l. c.) branches terete, and are, as well as the peduncles and pedicels, beset with longish retrograde stiff hairs; flowers in dense heads; bracteas glabrous inside; heads disposed in a crowded thyrse; inner lobes of calyx membranous, shorter than the outer ones. \( \textbf{H.} \) S. Native of Brazil, in the provinces of St. Paul and Rio Janeiro, in woods on the mountains. Melastoma acutilobum, Schrank et Mart. herb. L. melastomoides, Raddi, l. c. p. 7. t. 8. Tube of calyx oblong, campanulate, hairy. Petals very acute. Style filiform, exserted.

**Scabrous Leandra.** Shrub 3 to 6 feet.

8 \( \textbf{L. angustifólia} \) (D. C. l. c.) branches terete, and are, as well as the peduncles, clothed with short rusty down; leaves oblong-linear, 3-nerved, acuminate, ciliately serrated, scabrous from bristles above, villous beneath; heads axillary, sessile, few-flowered; bracteas linear; outer lobes of calyx subulate, villous; inner ones very short or hardly any. \( \textbf{H.} \) S. Native of Brazil. Flower-bud conical. Petals acuminate. Style exserted. Perhaps a species of \( \textbf{Clidemia} \), belonging to section *Axillaria*.

**Narrow-leaved Leandra.** Shrub 2 to 3 feet.

9 \( \textbf{L. d' ñua} \) (D. C. l. c.) branches rather tetragon, and are, as well as the panicles, pedicels, and leaves, rather hispid from scattered bristles; leaves petiolate, oblong, acuminate both at the base and the apex, ciliated, and triple-nerved; nerves arising from about the sixth part of the length of the leaves; pani
cle short, terminal; flowers crowded on the tops of the branches. \( \textbf{H.} \) S. Native of Brazil, in woods between Rio Janeiro and Lorea. Melastoma dubium, Schrank et Mart. mss. Lobes of calyx double, very short, hardly distinguishable.

**Double-leaved Leandra.** Shrub 3 to 6 feet.

10 \( \textbf{L. sylvestris} \) (D. C. l. c.) branches terete, and are, as well as the panicles, pedicels, and leaves, hispid; leaves peti
late, oval-oblong, acuminate at both ends, ciliated, entire, quin
tuple-nerved; pani
cle terminal, trifid at the base, divaricate; flowers bractless, approximating by threes; calyx ovate, hispid. \( \textbf{H.} \) S. Native of Brazil, in the province of Minas Geraes, in woods. Melastoma silvestre, Schrank et Mart. mss. Seeds small, angular, attenuated, shining. Lobes of calyx so short as hardly to be distinguishable.

**Wild Leandra.** Shrub 3 to 6 feet.

11 \( \textbf{L. bracteata} \) (Raddi, l. c. p. 8.) leaves oblong-lanceolate, acuminate, crenulate, 3-nerved, pilose beneath; flowers in terminal bractless racemes. \( \textbf{H.} \) S. Native of Brazil, on Mount Mambicoca near Rio Janeiro. Perhaps distinct from \( \textbf{L. syl
evèstre} \).

**Hairy Leandra.** Shrub 2 to 3 feet.

Sec. II. \( \textbf{Leandrodes} \) (so named from the plant being like Leandra in habit, but whether it is a true species of the genus is doubtful). D. C. prod. 3. p. 155. Calyx 4-cleft; lobes double. Bracteas and calyces clothed with stellateomentum. Petals and genital unknown.

12 \( \textbf{L. racemífera} \) (D. C. prod. 3. p. 155.) branches terete, and are, as well as the pedicels, densely clothed with branchedomentum; leaves on short pedicels, oblong, acuminate, reductly subcaudate, 3-nerved, or almost quinquelobate, glabrous above in the adult state, but scabrous from stellate down beneath; pani
cle terminal, elongated, racemose, oppositely branched; flowers crowded on the branches; calyces very hairy, 4-cleft. \( \textbf{H.} \) S. Native of Brazil. Melastoma racemífera, Schrank et Mart. mss. Anthers 8, oblong, obtuse. Raceme-bearing Leandra. Sh. 4 to 6 feet. Cult. See *Melastoma* for culture and propagation, p. 764.

**XLVII. Tschudyana** (dedicated to M. le Baron de Tschudy, author of Traité des Arbes comiques et resineux). D. C. prod. 3. p. 155.

**Lin. syst. Decándria, Monoginia.** Tube of calyx globose; lobes 5, bristle-formed, small, permanent. Petals 5. Stamens 10; filaments flatish; anthers oblong, without auricles, opening by one pore at the apex. Ovarium free, bristly at the apex. Style filiform, usually pilose at the base. Capsule globose, membranous, perhaps indeliscent, 4-5-celled. Seeds numerous, small, linearly incurved, crowned by a cellular acute curved appendage.—Shrubs, with the habit of *Clidemia*, clothed with rusty hairs in every part. Branches terete. Leaves on short pedicels, 5-nerved, oval, acuminate, toothed, having the nerves hairy on both surfaces. Thyrses panicled, terminal. Flowers small, very hispid, sometimes 4-cleft and ovoid-androus.

**Whorled Tschudyana.** Shrub 1 to 2 feet.

3 \( \textbf{T. asperíscula} \) (D. C. l. c.) branches of panicle oppo
site, short; leaves nearly quite entire. \( \textbf{H.} \) S. Native of Cá

4 \( \textbf{T. pulverulenta} \) (D. C. l. c.) branches of panicle oppo
site, 3-5-flowered; leaves quite entire, and rather ciliated; down on the branches of the panicle and on the leaves stellate. \( \textbf{H.} \) S. Native of Guiana, at Yuru, in woods. *Melastoma pulverulenta*, Rich. herb. Flowers small, 4-cleft, and sometimes the lower ones 3-cleft. Seeds like those of the rest of the genus, but the habit of the plant is by no means similar. Ovarium hardly villous at the apex. Stamens not seen. Leaves membranous.

**Powdery Tschudyana.** Shrub 3 to 6 feet. Cult. For culture and propagation see *Melastoma*, p. 764.

Linn. syst. Decandria, Monogynia. Tube of calyx ovate, naked, rarely bracteate at the base; lobes 5, permanent, narrow, acute. Petals 5, rarely 6. Stamens 10; anthers constricted at the base, and rather biauricled, opening by one pore at the apex. Ovarium adnate to the calyx, usually crowned by a circle of bristles at the apex. Style filiform; stigma a pruinose dot. Capsule baccate, 5-celled. Seeds ovate or rather angular, not coelolate, nor appendiculated.—Hispid or hairy shrubs, native of South America. Leaves usually crenated, 3-7-nerved. Flowers axillary and terminal. This genus is easily distinguished from the rest of the genera of the present order by the habit, but the species are difficult to define. Perhaps the species with obtuse petals are separable from those with acute petals.  

§ 1. Axillares. Flowers in axillary panicles or spikes.  

* Flowers crowded, almost sessile.  

1. **C. aggregata** (D. Don, in mem. soc. wern. 4. p. 300.) leaves elliptic, quite entire, acute at both ends, and are, as well as the branches, pilose; flowers axillary, verticillate, almost sessile. h. S. Native of Peru.  

**Aggregato-flowered Clidemia.** Sh. 1 to 2 feet.  

2. **C. Senicea** (D. Don, l. c.) leaves oval, acute, crenated, 5-nerved, clothed with silky vili on both surfaces; flowers solitary, axillary, verticillate, seamy at the base. h. S. Native of Peru. The rest unknown.  

**Silky Clidemia.** Sh. 2 to 3 feet.  

3. **C. confertiflora** (D. C. prod. 3. p. 156.) branches terete, densely clothed with retrograde vili; leaves on long petioles, oval, acute, nearly entire, villous beneath, and beset with short bristles above, 7-nerved; nerves crowded above the base of the leaves; panicles axillary, crowded, very short; tube of calyx very hairy. h. S. Native of Brazil, near Rio Janeiro, in woods. Melastoma aggregatum, Schrak et Mart. ms. Petioles an inch long, covered with spreading down. Sarac. long, yellow. Lobes of calyx 5, hardly distinct. Petals oval-lanceolate, flesh-coloured, but red in the middle. Anthers oval, furnished with filiform connectives. Style filiform.  

**Crowded-flowered Clidemia.** Sh. 3 to 4 feet.  

4. **C. retropila** (D. C. l. c.) branches hairy, beset with rufous retrograde pil; petals very hairy; leaves oval, acuminated, serrated, ovate-nerved, hairy or downy on both surfaces; nerves rather distant from the base; flowers in almost sessile clusters in the axils of the leaves; calyx hispid, 5-cleft. h. S. Native of Brazil. Petioles 5 lines long, rufous from spreading down. Lobes of calyx 5, sessate.  

**Bent-haired Clidemia.** Sh. 2 to 3 feet.  

5. **C. margina** (D. C. l. c.) branches nearly terete, and are, as well as the petals, clothed with small short powdery velutiny down; leaves petiolate, elliptic, acuminated, ciliated, triple-nerved, besides the marginal nerves, downy beneath, but beset with scattered bristles above; racemes few-flowered, axillary, 3 times shorter than the petiole; calyx very hispid, 5-cleft. h. S. Native of Brazil, near Rio Janeiro, on the mountains in woods. Melastoma margina, Desr. in Lam. dict. 4. p. 32. Melast. Januarensis, Schrak et Mart. ms. Flowers and fruit not sufficiently examined.  

**Margined-leaved Clidemia.** Sh. 3 to 4 feet.  

6. **C. amygdaloide** (D. C. l. c.) branches tetragonal, and are, as well as the petals and panicles, clothed with stiff bristles; leaves petiolate, oblong, acuminated, 3-5-nerved, somewhat crenulated, villous on both surfaces; panicles axillary, short, few-flowered; calyx very hispid, 5-lobed; lobes bearing small stellate down on the inside. h. S. Native of Brazil, in woods on mount Cercoado, near Rio Janeiro. Melastoma amygdaloideus, SCHRANK et Mart. ms. Leaves almost triple-nerved, 3 inches long, and 8-9 lines broad. Petals white, oblongly triangular, acute.  

**Almond-like Clidemia.** Sh. 4 to 6 feet.  

7. **C. brachyus** (D. C. l. c.) branches terete, and are, as well as the petals, densely hispid; leaves petiolate, elongately linear, acuminated, 3-nerved, ciliately serrated, bristly on the middle nerve above, the rest glabrous, but covered with long bristles beneath; spikes hispid, axillary, shorter than the petals. h. S. Native of Brazil, in the province of Rio Janeiro, in woods. Rhæsia spicata, Schrak et Mart. ms. Very near C. amygdaloideus. Fruit globose, hairy, crowned by the 5 short acute lobes of the calyx. Flowers not seen.  

**Short-spiked Clidemia.** Sh. 1 to 2 feet.  

8. **C. conglomerata** (D. C. l. c.) branches terete, hispid from thick branched hairs; petals clothed with the same kind of hairs; leaves ovate, attenuated at the base, acuminated at the apex, irregularly crenated and ciliated, 5-nerved, glabrous except on the nerves, membranous; flowers in terminal and axillary, almost sessile clusters; calyx beset with violaceous hairs, with 5 lobes, each ending in a plunose bunch of bristles. h. S. Native of Cayenne, in woods. A very beautiful species, allied to C. purpurea. Melastoma conglomerata, Rich. herb.  

**Conglomerate-flowered Clidemia.** Sh. 1 to 2 feet.  

9. **C. erythrocephon** (D. C. prod. 3. p. 157.) branches terete, and are, as well as the petals, hairy; leaves petiolate, oval-acuminate, denticulated, 5-nerved, beset with scattered stiff hairs on both surfaces; racemes axillary, almost sessile, 3-flowered; calyx very hispid from red bristles, with 6 sessetaceous lobes. h. S. Native of Jamaica. Melastoma sessilifolium, Spreng. syst. 2. p. 295. a. Petals and stamens not seen.  

**Red-bearded Clidemia.** Sh. 3 to 4 ft.  

**Pedaneae axillaris, 1-flowered.**  

10. **C. cilia** (D. Don, mem. soc. wern. 4. p. 309.) leaves coritate, acute, crenated, almost sessile, pilose above, densely clothed with stellate tomentum beneath; calyx tomentose. h. S. Native of Peru. Melastoma ciliata, Pav. in herb. Lamb. but not of Desr. nor Rich. Perhaps belonging to a different section.  

**Ciliated-leaved Clidemia.** Sh. 2 to 3 feet.  

11. **C. capillaris** (D. Don, l. c. p. 308.) leaves elliptic, crenated, 3-nerved, acuminate, clothed with silky vili on both surfaces, and on the branchlets; pedicels axillary, villous; 1-flowered. h. S. Native of Peru. Melast. capillaris, Pav. in herb. Lamb. but not of Swartz.  

**Capillary-pedicelled Clidemia.** Sh. 2 to 3 feet.  

**Pedaneae axillaris, bearing cymes or panicles of flowers.**  

12. **C. Epiplarion** (D. C. prod. 3. p. 157.) stem climbing, branched, terete, rooting, clothed with rufous hairs above, as well as the petals; leaves petiolate, ovate, acuminate, obtruse at the base, 3-7-nerved, denticulated, rather pilose; flowers few, in axillary racemose cymes; calyx hispid. h. S. Native of Brazil, in the province of Rio Negro. Melastoma Epiphitenum, Mart. herb. Melast. volubilis, Schrak, ms. A very distinct species. Leaves of calyx bristly at the apex. Anthers bluntly arculate at the base, opening by one pore at the apex. The name is derived from er(τ) upon, and (π) αντων, to walk, in allusion to the plant climbing upon others.  

**Climbing Clidemia.** Sh. climbing.  

13. **C. petiolata** (D. C. l. c.) branches terete, and are, as well as the petals, covered with rufous spreading hairs; leaves on long petioles, coritate-ovate, acuminate, 7-nerved, toothed, ciliated, with a few bristles above, but smoothish beneath;
flowers aggregate, almost sessile, few, hispid. *C.* S. Native of Guiana. Melastoma petiolar, Rich. herb. Easily distinguished from the other species in the leaves being cordate, and in the petals being 1-2 inches long.

Petiolate Clidemia. Sh. 1 to 2 feet.

14 C. hispida (D. Don. in mem. wern. soc. 4. p. 309.) branches terete, petals and panicles clothed with rufous villi; leaves ovate-lanceolate, somewhat attenuated at the base, and acuminate at the apex, denticulated, 5-nerved, densely pilose on the nerves, but sparingly so on the rest of the leaf; panicles axillary, trichotomous, few-flowered, hardly the length of the petals; calyx hispid, with an ovate tube and setaceous lobes; petals obovate. *C.* S. Native of Jamaica. Melastoma hirta, Lin. spec. p. 559. Swartz. obs. p. 175. Simrs. bot. mag. t. 1971. but not Desr. Melast. rústica, Forst. In. There is a variety of this plant with 6-petalled dodocandrous flowers.

Hairy Clidemia. Sh. 1 to 2 feet.

15 C. petiolar (Cham. et Schlecht. in Linnaea. 5. p. 562.) branches terete, silky at the apex; leaves ovate, acuminate, acute or obtuse at the base, 5-nerved, crenulately denticulated; cymes axillary, nearly sessile, trichotomous, beset with spreading hairs, shorter than the petals; tube of calyx hispid, hemispherical, longer than the lobes, which are setaceous; petals elliptic. *C.* S. Native of Mexico, among bushes near Hacienda de La Laguna, &c. Leaves 4 inches long, and 2 broad. Like C. hirta.

Petiolar Clidemia. Sh. 1 to 2 feet.

16 C. pauciflóra (D. C. L. c.) branches terete, and are, as well as the panicles, petals, and leaves, beset with long spreading stiff hairs; leaves on short petioles, ovate, acutish, rather cordate at the base, 5-nerved, ciliated, hardly crenulately; panicles terminal, few-flowered, oppositely branched; lobes of calyx 5, setaceous, shorter than the tube; calyx interpersed with bristles and short stammy Dow. *C.* S. Native of Brazil, in the province of Bahia. Melastoma pauciflóra, Desr. in Lam. dict. 4. p. 49. Melast. cryptodon, Schrak et Mart. Allied to C. elegans, but certainly distinct.

Few-flowered Clidemia. Sh. 1 to 2 feet.

17 C. crenatá (D. C. L. c.) branches from compressed to terete, and are, as well as the panicles, petals, and both sides of the leaves, hairy from long spreading pili; leaves petiolate, rather cordate at the base, broadly ovate, acuminate, crenatate, 5-nerved; panicles axillary, trichotomous, few-flowered, wideish, a little longer than the petiole; tube of calyx ovate, with subulate lobes; petals obovate. *C.* S. Native of Porto Rico, Brazil, Cuba, Trinidad, &c. Melastoma crenatá, Vahl. eel. am. p. 41. Icon. pl. am. 2. t. 82. Melast. aristítum, Mart. mss. Clid. hirta. D. Don. 1. c. There is no down between the hairs on the plant. Petals crenated, ex Rich. Perhaps not distinct from Clid. crenatá, D. Don.

Crenate-petiolate Clidemia. Sh. 2 to 3 feet.

18 C. eélégans (D. Don. 1. c. p. 309.) branches from compressed to terete, and are, as well as the panicles, petals, and both sides of the leaves, beset with long scattered stiff bristles; leaves cordate, acuminate, 5-nerved, ciliated, broadly crenated, crenate rounded and crenulated; panicles axillary, trichotomous, few-flowered, longer than the petiole; calyx hispid, with an ovate tube, and setaceous lobes; petals obovate. *C.* S. Native of Cayenne, on walls; and in Brazil. Melastoma elegans, Aubl. guian. 1. p. 425. t. 167. Flowers small, white.

19 C. tiléfolia (D. C. prod. 3. p. 158.) branches from compressed to terete, rather hispid, but at length glabrous; petals clothed with brown hairs; leaves ovate, cordate at the base, acuminate at the apex, doubly crenated, ciliated, rather pilose on both surfaces, 7-nerved; panicles axillary, trichotomous, few-flowered, longer than the petioles, loose, and are, as well as the calyxes, smoothish. *C.* S. Native of Brazil, at Para, in woods. Melastoma tiléfolium, Schrak et Mart. mss. Leaves crenated, as in C. elegans.

Lime-tree-leaved Clidemia. Sh. 2 to 3 feet.

20 C. blepharódes (D. C. L. c.) shrubby; branchlets terete, and are, as well as the petioles, hispid; leaves petiolate, ovate, acuminate, quite entire, 5-nerved, ciliated, rather bristly; racemes somewhat capitulate, lateral, pedunculate, hispid; bracteas ciliate; lobes of calyx setaceous, longer than the tube, which is campanulate and hispid; anthers oblong-linear. *C.* S. Native of Brazil, near Bannal and elsewhere. Melastoma blepharódes, Mart. Herb. Melast. Bannále, Schrak, mss. Style long, filiform, not dilated at the apex. Petals of a rose-purple colour. Fruit unknown. Perhaps a proper genus.

Eye-lash-bracted Clidemia. Sh. 1 to 2 feet.

21 C. urcoélata (D. C. L. c.) branches terete, and are, as well as the panicles, covered with glandular bristles and branchended down; leaves petiolate, cordate, acuminate, serrately ciliated, 5-nerved, setose above, but clothed with stellate tumentum beneath; panicles terminal, oppositely branched; calyx hairy, urcoélata, 5-leef. *C.* S. Native of dry mountains about Rio Janeiro. Melastoma urcoélatum, Schrak et Mart. mss. Petals obovate, rose-coloured. Allied to C. umbonátá.

Urcoélata-calyptra Clidemia. Sh. 1 to 2 feet.

22 C. bullósa (D. C. L. c.) shrubby; branchlets terete, and are, as well as the petioles, calyxes, and peduncles, clothed with rough stellate down; leaves petiolate, ovate, acuminate, somewhat cordate at the base, 7-nerved, ciliately serrated, covered with bullate bristles on the upper surface, and tumutum beneath; panicles axillary, terminal, loose-flowered; bracteas bristle-formed under the flower. *C.* S. Native of Brazil, at Para, in hedges. Melastoma bullósam, Schrak et Mart. mss. and perhaps the same as Melast. bullósum of Spreng. neue. endd. 2. p. 172. Calyx campanulate, short, with 5 short bristly teeth. Anthers oval, obtuse, opening by 1 pore. Flowers small, purplle. Fruit unknown.

Blistered-bristled Clidemia. Sh. 2 to 3 feet.

23 C. biserráta (D. C. L. c.) branches terete, and are, as well as the panicles and petals, clothed with branchended down, mixed with stiff glandular bristles; leaves petiolate, ovate, somewhat cordate at the base, acuminate at the apex, 5-nerved, doubly and unequally serrate-ciliated, beset with bristles on the upper surface, which are tumutum at the base, but covered with branchended down beneath, intermixed with foveolate bristles; panicles axillary, and nearly terminal, with opposite divericate branches; calyx ovate, acutely 5-lobed. *C.* S. Native of Brazil, in woods about Rio Janeiro. Melastoma biserrátum, Schrak et Mart. mss. Very like C. urcoélata and C. umbonátá. Petals ovate, purple.

Biserrate-leaved Clidemia. Sh. 2 to 3 feet.

24 C. umbonátá (D. C. L. c.) branches terete, and are, as well as the panicles, petals, and under side of the leaves, clothed with stellate branchended soft down; leaves petiolate, ovate, somewhat cordate, acuminate, ciliately serrated, covered with hairs on the upper surface, which are tumutum at the base; panicle terminal, oppositely branchended; calyx urcoélata. *C.* S. Native of Brazil, in hedges at Nogueira. Melastoma umbonátá, Schrak et Mart. mss. Petals ovate, purple.

Umbonate-fruited Clidemia. Sh. 2 to 3 feet.

25 C. purpurá (D. Don. mss. wern. 4. p. 308.) branches terete, hispid from spreading bristles, as well as the panicles; leaves broadly elliptic, acuminate, crenatate, 5-nerved, villous on both surfaces, but especially beneath, and when young they are purple, as well as the calyxes; peduncles axillary, 5 F
trichotomous, 3-flowered. \( \frac{1}{2} \) S. Native of Peru. Melastoma purpureum, Pav. in herb. Lamb. M. purpurascens, Domb.

**Purple-leaved Clidemia.** Sh. 2 to 3 feet.

26. C. dentata (D. Don, l. c.) leaves oval, crenated, acuminate, 5-nerved, covered with rough hairs on both surfaces, as well as the stem; peduncles short, axillary, trichotomous, many flowered. \( \frac{1}{2} \) S. Native of Peru. Melastoma dentata, Pav. in herb. Lamb.

Toothed-leaved Clidemia. Sh. 2 feet.

27. C. Japonensis (D. C. prod. 3. p. 159.) branches nearly terete, and are, as well as the petioles and panicles, hispid; leaves elliptic-oblong, acuminated, quite entire, membranous, rather pilose on both surfaces, and on the margins, 7-nerved; lateral nerves somewhat feathered from the middle to the base; panicles axillary, loose, shorter than the leaves; teeth of calyx setaceous, very short. \( \frac{1}{2} \) S. Native of Brazil, in the woods of Japura. Melastoma Japurense, Schrank et Mart. *mss.*

Flowers small. Fruit globose, crowned by the teeth of the calyx. Seeds small, angular. Anthers nearly terete, obtuse, hardly tumbly at the base.

**Japura Clidemia.** Sh. 2 feet.

28. C. plumosa (D. C. prod. 3. p. 159.) branches, petioles, peduncles, and calyxos woolly from rufous pilus; leaves oval, rather coriaceous at the base, acuminate, crenatulate, 5-7-nerved, pilose beneath, but especially on the nerves; panicles axillary, trichotomous; bracteas and calyces lobes plumose from purple bristles. \( \frac{1}{2} \) S. Native of St. Domingo. Melastoma plumosa, Desr. in Lam. dict. 4. p. 32. Leaves 6-7-inches long and 3 broad, standing on petioles one inch long.

**Plumose-calyxed Clidemia.** Sh. 2 to 3 feet.

29. C. latifolia (D. C. l. c.) branches and petioles hispid; leaves piloset, broad-ovate, acuminate, denticululate, ciliolate, 7-nerved, pilose on both surfaces, but especially on the nerves; panicles axillary, usually twin, trichotomous; bracteas setaceous; fruit spherical. \( \frac{1}{2} \) S. Native of the West Indies. Melastoma latifolia, Desr. in Lam. dict. 4. p. 31.

**Broad-leaved Clidemia.** Sh. 4 to 6 feet.

30. C. diversifolia (D. C. l. c.) branches terete, and are, as well as the petioles, panicles, and under surface of the leaves, clothed with silky powderly down; the leaves opposite each other are different in form, the one is large and broadly ovate, 7-nerved, and tapering abruptly into the petiole, the other is smaller and truly ovate, and almost sessile; panicles axillary, trichotomous, length of the smaller leaves; calyx with a globose tube, which is urceolate at the apex, and 5 subulate lobes. \( \frac{1}{2} \) S. Native on the banks of the river Magdalena, near St. Bartholomew. Melastoma diversifolia, Bonpl. mel. t. 59.

Fruit blue, 5-celled. Seeds cuneated. Petals small, white.

**Diverse-leaved Clidemia.** Sh. 4 to 6 feet.

* * *

**Peduncles axillary, spike-formed.**

31. C. spicata (D. C. l. c.) branches terete, and are, as well as the petioles and panicles, hispid from elongated bristles, intermixed with evenly powderly down; the leaves opposite each other are different in form, the one is large and broadly ovate, 7-nerved, and tapering abruptly into the petiole, the other is smaller and truly ovate, and almost sessile; panicles axillary, trichotomous, length of the smaller leaves; calyx with an ovate-globose tube, and setaceous acuminate lobes. \( \frac{1}{2} \) S. Native of Brazil, Brazil, Trindad, &c. Melastoma spicata, Anbl. guian. l. p. 423. t. 165. Vahl. ecl. 3. p. 20. Meyer in act. bonn. 13. p. 792. Flowers white. Berry red.

**Spicate-racemmed Clidemia.** Sh. 1 to 2 feet.

32. C. postulata (D. C. l. c.) branches terete, and are, as well as the petioles, hairy from short glandular down; leaves ovate, acuminate, obtuse at the base, and nearly coriaceous, ciliately subseriated, 7-nerved, scabrous from bristles above, and rather pubescent at the base of the bristles, but beset with fourto five scales of hairs beneath; panicles elongated, axillary, with their branches twice trifid or 3-flowered; calyx hispid, with acute lobes, which are shorter than the tube. \( \frac{1}{2} \) S. Native of Brazil, in the provinces of Rio Negro and Para, in woods. Melastoma postulatum, Schrank et Mart. *mss.*

Habit almost of C. spicata, but the thyrse is more loose, the lobes of the calyx are broader, and the hairs are different. Perhaps the same as C. strigulata.

**Postulate-leaved Clidemia.** Sh. 2 to 3 feet.

33. C. strigillosa (D. C. l. c.) branches rather tetragonal, and are, as well as the petioles, pilose; leaves obovate, rather coriaceous at the base, acuminate, 5-nerved, 3 times longer than the petioles, rather denticulated, hispid above, and clothed with ciliateomentum beneath; racemes axillary, with short opposite 3-4-flowered branches; calyx hairy, with filiform teeth; petals oblong. \( \frac{1}{2} \) S. Native of Jamaica. Melastoma strigillosa, Swartz. fl. ind. occ. p. 793. Berry roundish, hairy, 5-celled. Like C. spicata, but differs in the leaves being coriaceous at the base, and in the racemes being compound.

**Strigilosus Clidemia.** Sh. 2 to 3 feet.

34. C. capitella (D. Don, l. c. p. 310.) branches terete, and are, as well as the petioles, densely clothed with bracted down intermixed with a few bristles; leaves petiole, ovate, acuminate, 5-7-nerved, serrululate, very hairy above, and woolly beneath; peduncles axillary, bearing heads of flowers; lower heads of flowers opposite; flowers very hairy and crowded. \( \frac{1}{2} \) S. Native of New Granada, in shady woods. Melastoma capitellatum, Bonpl. melast. p. 5. t. 3. Lobes of calyx 5, obtuse, very hispid on the outside, but glabrous inside. Style filiform. Berry blue, rather globose. Flowers white.

**Heade-flowered Clidemia.** Sh. 6 to 12 feet.

35. C. neglecta (D. Don, l. c. p. 307.) leaves ample, coriaceous, acuminate, 7-nerved, very hairy on both surfaces, as well as the stems; spikes elongated, axillary, drooping, simple or compound; calyx girded by 5 scales at the base. \( \frac{1}{2} \) S. Native of Peru.

**Neglected Clidemia.** Sh. 5 to 4 feet.

§ 2. **Terminalia** (from terminus, the end; in reference to the spikes or panicles of flowers being terminal). D. C. prod. 3. p. 160. Spikes or panicles of flowers terminal. Flowers 5-petalous, deciduous.

* Thyrse spike-formed, terminal.*

36. C. spiriferiformis (D. C. prod. 3. p. 160.) branches clothed with silky villi; leaves broadly elliptic, crenulated, triple-nerved, acute at both ends, clothed with silky villi beneath; racemes terminal, spike-formed; pedicels 3-flowered. \( \frac{1}{2} \) S. Native of Peru. Melastoma spirifer, Pav. in herb. Lamb. but not of Aubl. Clid. spirata, D. Don, l. c. p. 308. Evidently distinct from the species of the same name from Guiana.

**Spike-formed Clidemia.** Sh. 2 to 3 feet.

37. C. depedens (D. Don, in mem. wern. soc. 4. p. 307.) leaves elliptic, acuminate, crenated, 8-nerved, very hairy on both surfaces, as well as the stem; spikes terminal, drooping; calyces sessile, each girded by 5 bracteas at the base. \( \frac{1}{2} \) S. Native of Peru. Melastoma depedens, Pav. in herb. Lamb.

**Dependent-spiked Clidemia.** Sh. 2 to 3 feet.

38. C. erosstrata (D. C. prod. 3. p. 160.) shrub densely clothed in every part with stiff ferruginous hairs; leaves petiolate, broadly ovate, obtuse, crenated, 5-7-nerved; spikes terminating the branches; flowers sessile along the branches, in crowded whorles. \( \frac{1}{2} \) S. Native of Brazil, at Coari. Melastoma erosstratum, Mart. et Schrank, *mss.* Allied to C. spicata, but differs in the leaves being obtuse, in the hairs being rufes-
cent, in the lobes of the calyx being small and oblong. Anthers oblong, falcate, each with a long connective. Style filiform.

**Beakless-anthered Clidemia.** Sh. 4 to 6 ft.

39 C. 

40 C. \n
41 C. 

**Ribbed-fruited Clidemia.** Shrub 2 to 3 feet.

40 C. \n
42 C. 

**Whorled-flowered Clidemia.** Sh. 2 to 3 feet.

**Thyrse panicled, terminal.**

41 C. \n
42 C. 

**Starry-haired Clidemia.** Sh. 3 to 4 feet.

42 C. 

**Serrulate-flowered Clidemia.** Sh. 2 to 3 feet.

43 C. 

**Dichotomous Clidemia.** Sh. 2 to 3 feet.

44 C. 

**Pilosë Clidemia.** Sh. 2 to 3 feet.

45 C. 

**S. Native of Peru. Melastoma triangulum, Pav. in herb. Lamb.**

**Swell Clidemia.** Sh. 4 to 6 ft.

46 C. \n
47 C. \n

48 C. 

**Reverse-haired Clidemia.** Sh. 1 foot.

48 C. **Unequal-leaved Clidemia.** Sh. 1 to 2 feet.

49 C. \n
50 C. \n
**Hairy Clidemia.** Sh. 2 to 3 feet.

51 C. 

**Depanipperate Clidemia.** Sh. 2 to 3 feet.

52 C. 

**Wreath Clidemia.** Sh. 3 to 4 ft.

53 C. 0
ovate or oblong, acuminate, obtuse at the base, and a little ciliated; nerves 5-7, somewhat feathered; panicle terminal, with opposite divaricate branches; calyx globose, very hairy, with 5 acute lobes, but the points being deciduous they at length become obtuse. ő. S. Native of Brazil, in woods, in the province of St. Paulo. Melastoma ápterum, Schrank et Mart. mss. The whole plant is brown when dried.

**Wingless Clidemia.** Shrub 2 to 3 ft.

53 C. purpureascens (D. C. l. c.) branches terete, and are as well as the panicles and petioles clothed with reflexed villi; leaves petiolate, oblong-lanceolate, acuminate, ciliated, hardly quite entire, 5-nerved; panicle terminal, rather loose, oppositely branched; calyx urceolate, hispid, 5-cleft, with the lobes glabrous on the inside. ő. S. Native of Brazil, near Oeiras, in the province of Bahia. Melastoma purpurascens, Schrank et Mart. mss. But is different from Melastoma purpurascens of Aubl. in the flowers being nearly twice the size. Branches and calyces brownish purple on the outside. Bracteas linear. Petals and genitians unknown.

**Purple Clidemia.** Shrub 3 to 4 feet.

54 C. Carassana (D. C. prod. 3. p. 162.) branches nearly terete, rather compressed, and are as well as the petioles, panicles, and under surface of leaves densely clothed with velvety stellate down; leaves on long petioles, oval, acuminate, scabrous on the upper surface from short, simple bristles, quinque-nerved; panicle terminal; style much exserted, acute. ő. S. Native of Brazil, in the high mountain called Carassa, in the province of Minas Geraes. Melastoma Carassana, Schrank et Mart. mss. Petioles 12-15 lines long. Ovarium bristly at the apex.

**Carassa Clidemia.** Shrub 1 to 2 ft.

55 C. bracteata (D. C. prod. 3. p. 162.) branches terete, and are as well as the panicles and petioles hairy from crowded, long, rusty rufous bristles; leaves oval, rather cuneate at the base, acuminated at the apex, 5-nerved, almost quite entire, ciliated, beset with stiff hairs beneath; thyrse panicled, terminal, with opposite branches, bearing dense heads of flowers at the apex, intermixed with ovate acut petraceae. ő. S. Native of Guiana, between Conana and Yueri. Melastoma tristis, Rich. herb. Flowers white.

**Bracteate-flowered Clidemia.** Shrub 1 to 2 feet.

56 C. mutabilis (D. C. l. c.) branches terete, and are as well as the petioles and peduncles very villous from rufous, adpressed, strigose hairs; leaves oval, cuneate at the base, acuminated at the apex, quite entire, 5-nerved, clothed with adpressed hairs on both surfaces; thyrse panicled, terminal, with opposite branches bearing heads of sessile bracteate flowers at the apex; calyx densely clothed with silky villi. ő. S. Native of Guiana, in shady woods. Melastoma mutabilis, Rich. herb. Very nearly allied to C. bracteatum, but differs in the calyxes being silky, not hairy, and in changing to a greenish-glau- cous colour on drying.

**Changeable-coloured Clidemia.** Shrub 1 to 2 feet.

57 C. lappacea (D. C. l. c.) branches terete, and are as well as the petioles covered with somewhat adpressed, thick, strigose hairs; leaves oval, somewhat acuminated, 5-nerved, ciliated, beset with scattered bristles on both surfaces, but hairy on the nerves beneath; thyrse panicled, terminal, short, with opposite branches, bearing heads of sessile bracteate flowers at the apex; fruit very hispid. ő. S. Native of Guiana, in woods. Melastoma lappaceae, Rich. herb. This species is nearly allied to the two preceding, but differs in the leaves being broadly crenate or somewhat bicrenate, and purple beneath.

**Burdock Clidemia.** Shrub 1 to 2 feet.

58 C. violacea (D. C. l. c.) branches terete, and are as well as the petioles, nerves of leaves, and calyces, clothed with adpressed silky villi; leaves on short petioles, ovate, acuminate, obtuse at the base, crenated, somewhat ciliated, quinque-nerved, beset with scattered hairs between the nerves; thyrse racemose, terminal, much shorter than the leaves, with crowded, 3-flowered bracteates; calyx densely clothed with hairs; petals oblong, obtuse. ő. S. Native of Cayenne, in shady woods. Melastoma violacea, Rich. herb. Fruit glossy, ribless, pilose, crowned by the limb of the calyx, which is very short and somewhat 5-toothed. Ovarium pilose at the apex. Leaves purplish.

**Violaceous-leaved Clidemia.** Shrub 1 to 3 feet.

59 C. coccinea (D. C. l. c.) branches terete, and are as well as the petioles clothed with adpressed bristles; leaves ovate-oblong, acuminate, toothed, triple-nerved, besides the 2 marginal nerves, beset with scattered bristles, but with silky villi on the nerves; thyrse terminal, panicled, beset with short hairs, with its branchlets opposite, and bearing 5 flowers each at the apex; calyx covered with short adpressed villi. ő. S. Native of Guiana, in shady woods. Melastoma cocinea, Rich. herb. Petals obovate; base, pubescent. Very like C. violacea, but the leaves are only purple beneath.

**Scarlet Clidemia.** Shrub 1 to 2 feet.

60 C. lanata (D. C. l. c.) branches, petioles, both surfaces of leaves as well as the branches and calyxes densely clothed with woolly down; hairs some of them sessile and stellate, others bristle-like and stellate at the apex; leaves petiolate, ovate, terminating in short taper points, 3-nerved, besides the 2 marginal nerves, denticulated; panicle terminal, crowded with flowers, having its branch opposite; teeth of calyx 5, obtuse. ő. S. Native of Guiana, Cuba, about the Bahamas, and the Island of Trinidad. Melastoma lanatum, Lamb. herb. Flowers white, very fragrant. Petals obovate. Anthers linear, opening by 1 pore, bluntly bicorniculate at the base. Ovarium giirded by a ring of bristles at the apex. Stigma somewhat capitate. A very distinct species.

**Wholly Clidemia.** Shrub 1 to 2 feet.

61 C. osceuba (D. C. l. c.) branches as well as the petioles, panicles, and under side of leaves densely clothed with rusty woolly down and small hairs; leaves petiolate, broadly ovate, acute, 5-7-nerved, quite entire, beset with pili above, which are bullate at the base; panicle terminal, with its branches opposite and crowded with flowers at the apex. ő. S. Native of Peru, in frigid places. Melastoma obscura, Bonpl. mel. t. 52. Limb of calyx campanulate, bluntly 5-toothed. Petals obovato-roundish. Ovarium half free from the calyx, furnished with 10 bristles at the apex. Stigma peltate. Berry 3-4-celled. Flowers white.

**Obscure Clidemia.** Shrub 2 to 3 feet.

62 C. involucrata (D. C. prod. 3. p. 163.) branches terete, and are as well as the petioles hairy; leaves petiolate, oval, attenuated at the base, acuminated at the apex, toothed, ciliate, calyx, triple-nerved, besides the marginal nerves, pilose on both surfaces; thyrse sessile, capitate, terminating the branchlets, bracteate or involucrated by 2 leaves, hairy, very short. ő. S. Native of Guiana, in woods. Melastoma involucratum, Rich. herb. Leaves thin, soft. Branches spreading. Heads of flowers a violaceous purplish colour.

**Involucrated Clidemia.** Shrub 2 feet.

**Panicules terminal, very hispid from purplish hairs.**

63 C. monodactylon (D. C. prod. 3. p. 163.) branches terete, and are as well as the petioles and nerves of leaves densely clothed with bristles; leaves beset with scattered bristles on both surfaces, petiolate, oblong, acuminated, serrated, ciliated, 3-nerved besides the marginal nerves; panicle terminal, much branched, divaricate, and are as well as the calyces very hispid
from long purplish bristles.  

S. Native of Brazil, in the province of Para, in woods. Melastoma rhodopogon, Schrank et Mart. mss. This is a very showy species. Petals purplish or white. Stamens not seen. Style filiform. Lobes of calyx 5, narrow, acute, confused with the bristles.

Red-bearded Clidemia. Shrub 2 to 3 feet.

* * * * * Panicles terminal. Petals lanceolate. Bristles on the stems spreading, and very stiff.

64 C. xantholaena (D. C. l. e.) branches terete, and are as well as the panicles and petioles hispid from long, spreading, stiff bristles; leaves petiolate, oblong, acute at the base, long-acuminated at the apex, 5-nerved, somewhat serrately ciliate, glabrous, except some bristles on the nerves beneath; panicle terminal; calyx urceolate, very hispid, bearing a few stellate soft hairs among the bristles.  

S. Native of Brazil, in the provinve of Rio Janeiro, on the mountains in shady places of woods. Melastoma xantholaenia, Schrank et Mart. mss. Hairs on the panicles and calyx yellow.

Yellow-haired Clidemia. Shrub 2 to 3 feet.

65 C. longissima (D. C. l. e.) branches nearly terete, and are as well as the panicles, petioles, and leaves, hispid from seastered, stiff, long bristles, intermixed with rufous down on the panicle; leaves oblong, petiolar, serrately ciliate, acuminate, obtuse at the base, 5-nerved; panicle terminal; bracteas linear, each ending in a bristle.  

Long-bearded Clidemia. Shrub 2 to 3 feet.

66 C. stenopectala (D. C. l. e.) shrubby; branches somewhat tetragonal, densely clothed with retrograde bristles; leaves petiolate, ovate, acuminate, serrated, 5-nerved, villous on both surfaces as well as on the margins; panicle terminal; calyx clothed with spreading stiff hairs or bristles; petals 5, linear-lanceolate, very acute.  

S. Native of the interior of Brazil. Melastoma stenopectala, Mart. et Schrank, mss. Lobes of calyx 5, narrow, acute. Flower-bud conical. Style filiform, not dilated at the apex, longer than the stamens. Antlers oblong, somewhat tuberculate at the base, obtuse at the apex, either opening by 1 or 2 pores. Fruit unknown.

Narrow-petalled Clidemia. Shrub 2 to 3 feet.

67 C. glomerata (D. C. l. e.) branches, panicles, petioles, and under surface of leaves hispid from long stiff bristles, intermixed with small, stellate down; leaves petiolate, ovate, short-acuminated, obtuse at the base, 5-nerved, ciliate, somewhat crenulated, bristly above; panicle terminal, capitulate, few-flowered.  

S. Native of Brazil, in woods. Melastoma glomeratum, Schrank et Mart. mss. Calyx and peduncles beset with black bristles; upper surface of leaves with yellowish ones, and the branches with retrograde ones.

Glomerate-flowered Clidemia. Shrub 1 to 2 feet.

68 C. nianga (D. C. l. e.) suffruticosum; branches tetragonal, and are as well as the petioles, peduncles, and calyxes hispid from deflexed spreading bristles; leaves on long petioles, ovate, hardly cordate at the base, long-acuminated, denticulate, 5-nerved; thyrse petiolate, terminal; flowers deciduous; lobes of calyx linear, ciliate with bristles, a little shorter than the tube; antlers beakless.  

S. Native of Brazil, in woods on Mount Ceareno near Rio Janeiro. Rhéseia Nianga, Mart. et Schrank, mss. Brstiles stiff, purplish, intermixed with down. Petals an inch long. Leaves 4 inches long. Branches of thyrse spreading or deflexed. Petals, according to the mss., white or very pale red. Fruit unknown. Perhaps a species of Melastoma. Nianga is the native name of the plant.

Nianga Clidemia. Shrub 1 to 3 feet.

69 C. foveolata (D. C. l. e.) branches nearly terete, and are as well as the panicles, petioles, and leaves hispid from thick, spreading, stiff bristles; leaves petiolate, oval-oblong, blunt at the base, and somewhat cordate, acuminate at the apex, serrulate, ciliate, rather blistered above, 3-5-nerved, but bristly and foveolate beneath; panicle oblong, terminal; calyxes bearing stellate down among the bristles.  

S. Native of Brazil, in the province of Minas Geraes, in irrigated places of woods. Melastoma foveolatum, Schrank et Mart. mss. Hairs on the lower surface of the leaves diverging, disposed in 3 rows on the sides of the nerves. Petals lanceolate, acute.

Foveolate-leaved Clidemia. Shrub 2 to 3 feet.

70 C. biseptena (D. C. prod. 3. p. 164.) branches from tetragonal to terete, and are as well as the panicles and petioles clothed with crowded, spreading, somewhat deflexed bristles; leaves on long petioles, ovate, blunt at the base, acute at the apex, toothed, ciliate, clothed with stiff villi on both surfaces, 7-nerved; panicles axillary and terminal, with opposite spreading branches; petals 7, linear-lanceolate, acute.  

S. Native of Brazil. Melastoma biseptenatum, Schrank et Mart. mss. Brstiles long, rufous. Calyx hispid, 5-cleft. Style filiform. Antlers oblong, obtuse, said to be allied to A. agrisitís.

Biseptenate-flowered Clidemia. Shrub 1 to 2 feet.

* * * * * Panicles terminal, with the branches spreading, and bearing the flowers on one side only.

71 C. heterobasis (D. C. l. e.) branches somewhat tetragonal, and are as well as the panicles, petioles, and leaves, especially on the under surface, clothed with soft hairs or down; leaves on long petioles, ovate, unequally cordate at the base, acuminate at the apex, 5-7-nerved, acutely and unequally toothed, ciliate; panicle terminal; calyx rather glandular, hispid, with 5 short, acuminate lobes.  

S. Native of Brazil, in the province of Para. Melastoma heterobasis, Mart. herb. Melast. soleniferum, Schrank, descr. Petals 12-15 lines long. Flowers small. Antlers violaceous, obtuse. Allied to C. secunda, but truly distinct from it in the leaves being somewhat cordate at the base, in being toothed, not serrated, and in the hairs being soft, not bristly, &c.

72 C. intermedia (D. C. l. e.) branches terete, and are as well as the panicles, calyxes, petioles, and leaves clothed with adpressed bristles; leaves on long petioles, ovate, acuminate, obtuse at the base and somewhat cordate, ciliate serrated, 5-nerved; panicle terminal, with its branches spreading and bifid; flowers sessile, secund.  

S. Native of Brazil, in woods at Rio Negro. Melastoma hispidum, Mart. herb. Very like C. secunda, but differs in the leaves being of the form of those of C. heterobasis.

Intermediate Clidemia. Shrub.

73 C. secundiflora (D. C. l. e.) branches terete, and are as well as the calyxes, panicles, petioles, and leaves clothed with adpressed stiff villi; leaves petiolate, oval, acuminate, ciliate serrated, 5-nerved, or almost quintuple-nerved; panicle terminal, with its branches spreading and bifid; flowers sessile, secund.  

S. Native of Brazil, in woods, at Para, and Rio Negro. Melastoma secundium, Mart. et Schrak. mss. The habit of the plant and the inflorescence agrees with C. liebmannii, but differs in the hairs being adpressed, not spreading, in the lobes of the calyx being entire, not ciliate jaged, and in the bractes being linear-subulate, not almost wanting. Antlers obtuse.

Secund-flowered Clidemia. Shrub 4 to 5 feet.

74 C. inequaliflora (D. C. l. e.) branches from tetragonal to terete, and are as well as the petioles and panicles clothed with spreading hairs; leaves petiolate, oval, obtuse at the base, ending each in a long, narrow acumen at the apex, serrulate,
5-nerved, bristly above, but clothed with villi beneath, those opposite each other usually of a different size; panicles terminal. \( T \) S. Native of Brazil, in woods, in the province of Para. Melastoma inaequilobium, Schrank et Mart. sess. Leaves sometimes equal in size, sometimes very unequal, the larger ones 6-7 inches long, and the smaller ones 1-2 inches. Flowers small, 5-leaved. Style filiform, exserted. Anters not anured at the base.

**Unequal-leaved Clidemia.** Shrubs 2 to 4 feet.

75. \( C. \) laevis (D. C. L. c.) branches terete, and are as well as the petioles and peduncles hispid, 7-nerved, long, scattered, spreading bristles; leaves petiolate, ovate-lanceolate, acuminate, 5-nerved, dentilicate, ciliolate, hairy on both surfaces; branches of terminal panicle dichotomous; flowers sessile, second; calyx with a globose tube; and 5 lobes, which are furnished with palpately disposed bristles at the apex. \( T \) S. Native of New Granada, on Mount Quindio, and at the town of Marigua. Melastoma lacera, Bonpl. mel. t. 5. Petals ovate, white. Berry 3-celled. **Jagged-calyxed Clidemia.** Shrubs 3 to 6 feet.

76. \( C. \) secunda (D. Don, in mem. wern. soc. 4, p. 308.) leaves oval, acuminate, 5-nerved, crenulated, rounded at the base, very pilose on both surfaces as well as the stems; panicle terminal, divaricate, with bifid, many-flowered bracteas; flowers sessile. \( T \) S. Native of Peru. Melastoma secundum, Pav. in herb. Lamb. **Side-flowered Clidemia.** Shrubs 3 to 4 ft.

77. \( C. \) lamberthiana (D. C. prod. 3, p. 161.) leaves oblong, cordate, acute, 5-nerved, crenulated, very pilose on both surfaces as well as on the stems; panicle ample; flowers sessile; calyx seamy at the base. \( T \) S. Native of Peru. Melastoma lamberthiana, Pav. in herb. Lamb. but not of Vahl. Clidemia crenata, D. Don, mem. wern. soc. 4, p. 308. Melastoma lamberthiana, Sch. sess.

**Lambert's Clidemia.** Shrubs. Cult. The species of Clidemia are by no means showy, and on that account are not very desirable. Their culture and propagation are the same as that for Melastoma, see p. 764.

**XLIX. Myriaspora.** (from \( \mu \) ryas, myrias, a myriad, and spora, spora, a seed; in reference to the innumerable seeds contained in the fruit). D. C. prod. 3, p. 165.

1. \( M. \) egensis (D. C. prod. 3, p. 165.) leaves oblong; lobes of calyx hispid on both sides. \( T \) S. Native of Brazil, in woods, at Ega, in the province of Rio Negro. Melastoma Egensis, Mart. herb. Bläckia Egensis, Schrank, sess. **Ege Myriaspora.** Shrubs 3 to 6 feet.

2. \( M. \) paulensis (D. C. L. c.) leaves oval; lobes of calyx glabrous on the inside. \( T \) S. Native of Brazil, in the province of Rio Negro. Melastoma Paulensis, Schrank, sess. Perhaps only a broad-leaved variety of \( M. \) egensis. **St. Paul Myriaspora.** Shrubs 4 to 6 feet.

Cult. See Melastoma, p. 764, for culture and propagation.

**L. TOCOCA.** (Tococa is the name of \( T. \) Guianensis, by the Indians of Guiana.) Aubl. guian. 1, p. 438. D. C. prod. 3, p. 165. Tococa species. D. Don, in mem. wern. soc. 4, p. 303. — Melastoma species of authors. **Lin. syst.** Decandria, Monogynia. Tube of calyx oblong, glabrous, naked at the base; limb urceolate, permanent, 5-celled; lobes broad, short, obtuse, usually ciliolate. Petals 5, obovate. Stamina 10; anthers equal, furnished each with a very short or hardly evident connective, which is bicipitate at the base. Ovaryum crowned by a circular line of bristles. Style cylindrical, crowned by a large, orbicularly peltate stigma. Capsule bacate, 5-celled. Seeds ovate, angular, with a linear hyalum. — South American shrubs, hispid from thick hairs or bristles. Branches tetragonal. Leaves opposite, equal, 3-5-nerved. Petioles short, bristly, tumid, or inflated at the apex into 2 bladders, which are open at the apex. Flowers white or rose-coloured, disposed in a thyrse composed of racemes.

1. \( T. \) guianensis (Aubl. l. c. t. 174.) branches tetragonal or compressed between the nodes, covered with bristles on the angles; leaves broadly ovate, acuminate, hardly crenulated, 5-nerved, bristly on the margins and margins, and beset with scattered bristles above; petioles inflated above; panicle terminal; calyx ciliated pilose. \( T \) S. Native of Guiana. Melastoma physophora, Vahl. ecol. 1, p. 45. Poir. supp. 3, p. 629. Melastoma Tococa, Desr. in Lam. dict. 4, p. 39. Petiole hardly 3 lines long beneath the bladder, which is subglobose. Limb of calyx campanulate, with the teeth broad at the base and acute at the apex, ciliolate. Petals conca, rose-coloured. Berry oval, purple. T. Anhletia, D. Don, l. c. **Guiana Tococa.** Fl. Aug. Sept. Cit. 1826. Sh. 3 to 4 ft.

2. \( T. \) forntica (Mart. herb. ex D. C. prod. 3, p. 165.) branches somewhat tetragonal terete, beset with long, scattered bristles; leaves oval, acute, acuminated, 5-nerved, serrated, beset with bristles on the borders and on the nerves of the petiole, but with scattered bristles above; petiole inflated at the apex; panicle terminal; calyx glabrous. \( T \) S. Native of Brazil, in the province of Goyaz, in woods. Very like the preceding species. Leaves 10 inches long. Petiole almost an inch long, beneath the bladder, which is ovate and erect. Lobes of calyx awned.

**Insect Tococa.** Shrubs 3 to 4 feet.

3. \( T. \) bullifera (Mart. et Schrank, sess. ex D. C. l. c.) branches terete, but tetragonal at the apex as well as the rachis, sparingly pilose; leaves elliptic-oblong, acuminated, ciliolate, almost quite entire, 5-nerved, membranous, beset with minute, scattered bristles on both surfaces; petiole inflated into an elongated bladder; calyx rather pilose. \( T \) S. Native of Brazil, in the province of Para, in woods. The rachis of the simple raceme nearly tetragonal. Petiole 4 lines long, beneath the bladder, which is nearly an inch long.

**Blister-bearing Tococa.** Shrubs 2 to 3 feet.

4. \( T. \) vesiculosa (D. Don, in mem. wern. soc. 4, p. 305.) stem beset with spreading pili; leaves hardly unequal, on long petioles, ovate, 5-nerved, acut, bearing 2 bladders at the apex of the petiole; cyme panicled, axillary, pedunculate. \( T \) S. Native of Mexico.

Melastoma vesiculossa, Moc. et Sesse, fl. mex. icon. ined. Flowers small, rose-coloured.

**Bladder-petioled Tococa.** Shrubs 2 feet.

5. \( T. \) sanguinea (D. Don, in mem. wern. soc. 4, p. 305.) the whole plant clothed with blood-coloured hairs; leaves coriaceous, ovate, acuminated, 5-nerved, crenulated, densely clothed with stiff hairs on both surfaces as well as the stem; calyx furnished with scales at the base; filaments glandular; style short. \( T \) S. Native of Peru. **Bloody-haired Tococa.** Shrubs 2 to 3 feet.

Cult. The plants of this genus are remarkable for bearing
bladders on their petioles. Their culture and propagation is the same as that recommended for _Melastoma_, see p. 764.

**LI. MAIETA** (the author does not explain the meaning of this name). Aubl. guian. 1. p. 443, but not of Veit. D. C. prod. 3. p. 166.—Toecca, spec. D. Don.—Melastoma spec. of authors.

**LIN. SYST.** Decaloba, Monogynia. Tube of calyx oblong-ovate, more or less hispid, and usually bracteately lobed 5, subulate. Petals 5, obvolute. Stamens 10. Anthers equal, each furnished with a very short connective, which is biauriculated behind. Ovary inflamed above, and as if it were truncate. Style filiform; stigma capitate. Capsule baccate, 5-celled. Seeds ovate, angular.—American subshrubs, hispid from thick pili. Branches from compressed to terete. Leaves on short petioles, those opposite each other of unequal size, the largest of the two bladdery at the base of the limb; the bladders usually confluent. Flowers solitary or few in the axils of the leaves.

1 M. Guianensis (Aubl. guian. 1. p. 443. t. 176.) branches and petioles beset with spreading bristles; leaves of unequal size, on short petioles, the larger ones ovate, acuminate, somewhat denticulated, 5-nerved, obtrorse at the base, bearing a bladder at the base of the limb, the smaller ones oblong, without any bladder; flowers axillary, solitary, on short pedicels; teeth of calyx subulate, elongated; bracteae 4, acuminate. \( h \). S. Native of French Guiana, in woods. Melastoma Maietta, Desr. in Lam. dict. 4. p. 34. Toecca Maietta, D. Don, in mem. soc. 4. p. 303. Flowers white.

**Guianae Maieta.** Shrub 2 feet.

2 M. hypophylla (D. C. prod. 3. p. 166.) branches and petioles beset with a few spreading bristles; leaves of unequal size, on short petioles, the larger ones oval, acuminate, somewhat serrulated, 5-nerved, obtuse at the base, bearing a bladder at the base of the limb, the smaller ones oval-oblong, acuminate, without any bladder; flowers axillary, numerous, almost sessile; teeth of calyx short, subulate; bracteae 4, broad, each ending in a short acumen. \( h \). S. Native of Brazil, in woods.

**Melastoma Maieta** and M. hypophyllum, Schrank et Mart. mes. Very near _M. Guianensis_, but differs in the branches being more compressed and less bristly, while the calyxes are more bristly and teeth shorter.

**Under-bladder-leaved Maieta.** Shrub 2 to 3 feet.

3 M. heterophylla (D. C. l. c.) branches and petioles hispid from spreading bristles; leaves of unequal size, the larger ones petiolate, bearing 2 bladdery at the top of the petiole, oval-oblong, acuminate, the smaller leaves sessile, cordate, and stem-clasping, nearly orbicular, mucronate, not bladdery; calyxes axillary, pedunculate, few-flowered. \( h \). S. Native of Peru. Melastoma heterophylla, Desr. in Lam. dict. 4. p. 43. Toecca heterophylla, D. Don, l. c.

**Variable-leaved Maieta.** Shrub 2 to 3 feet.

**Cult.** See _Melastoma_ for culture and propagation, p. 764.

**LIII. CALOPHYSA.** LIII. SNEERILA. 775

shaped, in the anthers being without auricles, and in the stigma not being dilated.

**II. C. TOECODARIEA** (D. C. l. c.). \( h \). S. Native of Brazil, in shady places. Branches terete, and are as well as the petioles beset with spreading, stiff bristles. Bladders roundish, one on each side at the base of the petiole. Leaves cordate, acute, 7-nerved, toothed, ciliate, beset with scattered bristles above, and with bristles on the nerves beneath, but glandular between the nerves. Cymes few-flowered, axillary, crowded, short.

**Toecca-like Calophyse.** Shrub.

**Cult.** See _Melastoma_ for culture and propagation, p. 764.

**LIII. SNEERILA** (Sooti Soleri-ila is the name of _S. maculata_ in the Khassee language). Roxb. fl. ind. 1. p. 180. Wall. pl. asiat. rar. 2. t. 2. Blume in bot. zeit. 1851. no. 27. p. 489.

**LIN. SYST.** Triandra, Monogynia. Tube of calyx oblong or somewhat trigonal, usually mucrinated, adhering to the ovary; limbs trid, with the segments deciduous. Petals 3, ovate-lanceolate, acute. Stamens 3. Anthers linear-oblong, straightish, emarginate at the base, opening by 2 pores at the apex, without any appendages. Ovarium truncate at the apex, glabrous. Style filiform; stigma obtuse. Capsule turbinate, crowned by the margin of the calyx, which is thickened on the inside, 3-celled, 3-valved, valves opening only at the apex. Seeds cuneate, angular, of 2 forms.—Usually small shrubs, rarely annual plants. Branches terete. Leaves opposite, rarely scattered, those opposite each other are for the most part unequal in size, one of which is sometimes almost abortive, quite entire or toothed, membranous, hairy. Peduncles axillary and terminal, racemos or fasciculate, few or many-flowered. Flowers rose-coloured. The ternary number of the parts of the flower is sufficient to distinguish this genus from all others of _Melastomaceae_.

**SECT. I. SNEERILA (see genus for derivation).** Blum. l. c. p. 490. Calyx hairy, hardly angular. Petals ovate, acute, broad at the base. Capsule turbinate, opening by 3 valves, which are bipartite at the apex.

1 S. BEGONIIFOLIA (Blum. l. c.) stem herbaceous, hairy; leaves quinquepart or septuplicate, obliquely cordate at the base, acute, quite entire, ciliate, scabrous above, but beset with small appressed bristles beneath, those opposite each other unequal in size, one of them almost sessile and heart-shaped; racemes axillary and terminal, many-flowered; flowers sessile. \( h \). S. Native of Java, at the river Tjarvja, in the province of Bantam. Flowers rose-coloured.

**Begonia-leaved Sinerila.** Pl. 1 foot.

2 S. MOLUCCA (Roxb. fl. ind. 1. p. 182.) leaves in pairs, entire, having one minute and nearly round, the other unequally cordate; racemes umbellet. \( h \). S. Native of the Moluccas. Flowers rose-coloured.

**Moluca Sineerila.** Pl. 1 foot.

3 S. PAUVICFLORA (Blum. l. c. p. 491.) suffruticose; stems beset with stiff hairs; leaves 5-nerved, besides the marginal nerves, oblong, acuminate, auriculately semi-cordate at the base, denticulated, and rather hairy, those opposite each other unequal in size, one of which is cordate and sessile; peduncles axillary, few-flowered. \( h \). S. Native of Java, on the mountains. Flowers rose-coloured.

**Few-flowered Sinerila.** Shrub 1 to 2 feet.

**SECT. II. TRIGONOCAPSUS (from treis, three, and woyna, gonia, an angle; in reference to the trigonal capsule and calyx)._Blum. l. c._ Calyx glabrous, trigonal. Petals ovate-lanceolate, acute at both ends. Capsule turbinate, attenuate at the base, trigonal; valves 3, undivided, dehiscent. Leaves opposite, nearly equal, hardly oblique at the base.
4. *S. erecta* (Jacq. mal. misc. 1. no. 5. p. 7.) stem fruticose, with 2 opposite downy leaves; leaves 3-nerved, lanceolate, acute at both ends, serrated, hairy; spikes terminal, few-flowered. 

*S. native* of Pulo-Penang, in woods. Flowers red.

**Erect Sonerila.** Shrubs 1 to 2 feet.

5. *S. squarrosa* (Wall. in Roxb. fl. ind. 1. p. 182.) stem suffruticose; erect, glabrous, almost simple, with numerous stipularly soft prickles; leaves crowded towards the top of the plant, cuneate-lanceolate, ciliate, serrated, smooth, tapering into the petioles, which are very short; racemes terminal and axillary; flowers secund. 2. S. Native of the East Indies, growing among ferns on the Kerala mountains, where it is called *Tecaranga*. Petals oval, acute, contracted at the base, rose-coloured. Antlers bicoloured, opening on both sides along their whole length. ex Wall. l. c.

**Squarrose Sonerila.** Pl. 1½ to 4½ foot.

6. *S. angustifolia* (Roxb. fl. ind. 1. p. 182.) stem suffruticose; leaves ovate-oblong, acuminate, nearly equal, ciliate, acute at the base, beset with simple hairs on both surfaces, as well as on the branches; racemes terminal and lateral, few-flowered. 2. S. Native of the mountains, on the north-east border of Bengal. Flowers rose-coloured.

**Narrow-leaved Sonerila.** Pl. 1½ to 1 foot.

7. *S. maculata* (Roxb. fl. ind. 1. p. 180.) stem short; branches recurved, rooting at the apex, bristly; leaves on long petioles, unequally broad-ovate-cordate, acuminate, ciliate, serrated; beset with small, white, elevated specks, from the centre of each rises a bristle; racemes axillary, spiral, on hairy coloured peduncles. 2. S. Native among the mountains upon the north-east border of Bengal, and where it is used by the natives as a pot-herb. Its vernacular name in the Khasse language is *Sooti-Soneri-ila*. Rheed. mal. 9. p. 127. t. 65. Flowers rose-coloured.

**Spotted-leaved Sonerila.** Pl. 1½ foot.

8. *S. emaculata* (Roxb. fl. ind. 1. p. 181.) leaves unequally narrow-cordate, acute, bristly, but without spots, serrated, ciliate. 2. H. Native among the Kerala mountains, on the north-east border of Bengal. It differs from *S. maculata*, in the leaves being destitute of little round white dots, from which the bristles rise. It is also less robust than that plant, with longer peduncles to the racemes, but the flowers and capsules are alike.

**Spotted-leaves Sonerila.** Pl. 1 foot.

9. *S. tenuiifolia* (Blum. l. c.) stem suffruticose, rough; leaves 3-nerved, opposite, one of which is smaller than the other, ovate-lanceolate, acuminate, obtuse, or rather cordate at the base, serrated, beset with scattered bristles above, rather glaucous beneath; peduncles terminal, 1-3-flowered. h. S. Native of Java, in woods. Flowers red.

**Fine-leaved Sonerila.** Sh. 1 to 2 feet.

**Cult.** For culture and propagation of the stowe species, see *Melastoma*, p. 764.; but see *Centradenia*, p. 760, for that of the annual kinds. Rather pretty plants when in flower.

**LIV. MEDINILLA.** (meaning unknown to us.) Gaud. ined. ex D. C. prod. 3. p. 167. Blum. in bot. zeit. 1831. no. 29. p. 508.

**Lin. syst.** Octo-Decandra, Monogynia. Tube of calyx ovate or obovate, ribless, adhering to the ovary; limb truncate or obliquely 4-5-toothed, rarely cleft irregularly, continuous with the tube. Petals 4-5, oval or obovate, obtuse or obliquely truncate, rather fleshy. Stamens 8-10, equal, or the alternates one is smaller; anthers oblong-linear, arched, beaked, and opening by one pore at the apex; their connectives 2-lobed or bifid in front, but spur-formed behind, and confluent with the anthers. Ovarium glabrous at the apex, rarely downy. Style subulate, tumid at the base, crowned by a small obituse stigma. Berry ovate-oblong, or ovate-globose, crowned by the limb of the calyx, 4-5-celled. Seeds oval, smoothish.—Smoothish shrubs, rarely covered with stellate down, sometimes serrate, and sometimes parasitic; branches terete or tetragonal. Leaves opposite or in whorls, petiolate or sessile (branches sometimes with a circle of tomentum or ramentae at the insertion of the leaves), quite entire, rarely dentilicate, nerved. Cymes or umbels simple and few-flowered, or disposed in many disposed compound panicles or corymbs, axillary, or terminal. Flowers very pale red; pedicels reddish.

**Sect. I. CAMPTOPLACU'NTIA (from *campto*, to bend, and *placu'ntia*, a placenta; in reference to the placenta, which is bent).** Blum. l. c. p. 509. Tube of calyx ovate; limb cylindrically tubular, somewhat truncate, rarely cleft. Seminiferous receptacle bent in on both sides between the cells. Smooth shrubs, with whorled petiolate leaves. Cymes few-flowered, axillary; pedicels bracteolate, and articulated at the base.

* Flowers octandrous.

1. **M. quadrifolia** (Blum. l. c. p. 509.) branches terete; leaves usually 4 in a whorl, rarely 3 or 5, cuneate-oblong, acute, triple-nerved. h. S. Native of Java, on Mounts Gede and Salak, in woods. *Melastoma quadrifolium*. Blum. bijdr. p. 1069.

* Four-leaved Medinilla. Sh. 4 to 6 ft.

2. **M. rosea** (Gaud. in Freyc. voy. pt. bot. p. 484. t. 106.) branches bluntly tetragonal; leaves 3-4 in a whorl, ovate, mucronate, triple-nerved. h. S. Native of Marianne Island. Tube of calyx ovate, exactly truncate. Peduncles axillary, 6-8-flowered. Flowers and berries rose-coloured.

* Rose-coloured-flowered Medinilla. Sh. 4 to 6 ft.

3. **M. radicans** (Blum. l. c.) branches terete, rooting; leaves 3-7-nerved, oblong-lanceolate, acuminate at both ends, rather venous. h. S. Native of Java. Melastoma radicans. Blum. bijdr. p. 1069.

* Rooting Medinilla. Sh. 4 to 6 ft.

** Flowers decandrous.

4. **M. petrocau'la** (Blum. l. c. p. 509.) branches with membranous wings; leaves 4-8 in a whorl, oblong-lanceolate, acuminate, tapering into the petiole at the base, triple-nerved. h. S. Native of Java, in the provinces of Buitenzorg, Tjaron, and Bantam, in woods on the mountains.

* Wing-stemmed Medinilla. Sh. 3 to 6 ft.

5. **M. crassinea'ria** (Blum. l. c. p. 510.) branches terete; leaves 4 in a whorl, acute, rather cuneated at the base, triple-nerved, fleshy; peduncles usually 1-flowered. h. S. Native of the Island of Banda, on Mount Baudao.—Rumph. amb. 5. p. 67.?

** Thick-nerved-leaved Medinilla. Sh. 4 to 6 ft.

6. **M. macroca'pa** (Blum. l. c.) branches nearly terete; leaves 4 in a whorl, oval, acute, cuneated at the base, triple-nerved; limb of calyx irregularly cleft. h. S. Native of the Moluccas.—Rumph. amb. 5. p. 67. t. 35. f. 2.

* Long-fruited Medinilla. Sh. 4 to 6 ft.

**Sect. II. SARCOPLACU'NTIA (sarp* sarpoc, sar'oc sarco, fleshy, and *placu'ntia*, a placenta, in reference to the placenta being fleshy).** Blum. in bot. zeit. 1831. no. 29. p. 510. Tube of calyx obovate or nearly globose; limb short, truncate, or denticulate. Seminiferous receptacle thick, fleshy, hence the berries are at length pulpy, with the seeds imbedded in the pulp. Smooth shrubs, with opposite, rarely whorled, petiolate or sessile leaves. Peduncles axillary
and terminal, cymose, few or many flowered; pedicels bibracteate in the middle.

* Flowers *fen*, cymose or subcorymbose.

7 M. laurifolia (Blum. l. c. p. 511.) branches terete, warty; leaves opposite, rarely in threes, ovate, attenuated at both ends, triple-nerved, rather fleshy; peduncles axillary, exceeding the length of the petioles, usually 3-flowered; flowers decandrous or dodecandrous. Ῥ. S. Native of Java, on trees.

Laurel-leaved Medinilla. Sh. 4 to 6 ft.

8 M. cissifolium (Blum. l. c.) branches terete, warty; leaves ovate-oblong, acuminate, obtuse at the base and emarginate, obsolete 5, rarely 5-nerved; umbels axillary, in simple or trifid corymb; flowers decandrous. Ῥ. S. Native of Java, on Mount Salak on trees. Melastoma cissifolium, Blum. bijdr. p. 1075.

Var. B. diaphana (Blum. l. c.) leaves larger, thinner, and somewhat 5-nerved. Ῥ. S. Native along with the species. Melastoma diaphanum, Blum. bijdr. p. 1076.

Thick-leaved Medinilla. Sh. 4 to 6 ft.

Reddish-calyced Medinilla. Sh. 2 to 3 ft.

10 M. Hasseltii (Blum. in bot. zeit. 1851. no. 30. p. 513.) branches terete, warty; leaves opposite, on short petioles, lanceolate-oblong, acuminate, somewhat cordate at the base, 3-nerved, fleshy; cymes branched, axillary; flowers octandrous. Ῥ. S. Native of Java, in the province of Bantam, about Harriang and Levebonger.

Hasselt's Medinilla. Sh. 4 to 6 ft.

11 M. succulentà (Blum. l. c.) branches terete, warty; leaves opposite, sessile, ovate-oblong, acuminate, obtuse at the base, triple-nerved, fleshy; cymes branched, axillary; flowers octandrous. Ῥ. S. Native of Java, on trees, in humid woods. Melastoma succulentum, Blum. bijdr. p. 1070.

Succulent-leaved Medinilla. Sh. 4 to 6 ft.

12 M. hypercifolia (Blum. l. c.) branches terete; leaves opposite, sessile, ovate-lanceolate, acuminate, rather cordate at the base; cymes a little branched; flowers decandrous, rarely octandrous. Ῥ. S. Native of Java, on trees on Mount Salak. Melastoma hypercifolium, Blum. bijdr. p. 1070. Flowers small.

St. John's-wort-leaved Medinilla. Sh. 4 to 6 ft.

* Flowers in terminal and axillary elongated panicles.

13 M. verrucosa (Blum. l. c. p. 514.) branches warty, when young tetragonal, when old terete; leaves opposite, sessile, oblong, subcordate, acuminate, finely denticulated towards the apex, quintuple-nerved; panicles terminal or axillary, drooping; flowers deciduous; calyx somewhat truncate. Ῥ. S. Native of Java, in shady places on Mount Salak. Melastoma verrucosum, Blum. bijdr. p. 1078.

Warted-branched Medinilla. Sh. 2 to 3 ft.

15 M. Kuillhi (Blum. l. c.) branches when young 4-sided; leaves opposite, on short petioles, elliptic-oblong, acuminate, bluntest at the base, triple-nerved, as well as with 2 marginal obsolete nerves; panicles axillary or terminal, elongated; flowers decandrous; calyx obsolete 5-toothed. Ῥ. S. Native of Java, on Mount Pangarangliu.

Kuhl's Medinilla. Sh. 4 to 6 ft.

16 M. javanensis (Blum. l. c. p. 515.) branches all 4-sided; leaves opposite, sessile, somewhat cordate, elliptic, rather acuminate, quintuple-nerved, quite entire; panicles terminal or axillary, divaricate, straight; flowers decandrous. Ῥ. S. Native of Java, in marshes and woods on the higher mountains. Melastoma Javanensis, Blum. bijdr. p. 1078. M. Epidendrera, Reinw. ined.

Java Medinilla. Sh. 4 to 6 ft.

17 M. eximia (Blum. l. c.) branches irregularly 4-sided; leaves opposite, on short petioles, elliptic-ovate, acute at both ends, quintuple-nerved, quite entire; panicles terminal; flowers octandrous. Ῥ. S. Native of Sumatra, on the banks of rivers. Melastoma eximia, Jack, in Lin. trans. 14. p. 17. Leaves large. Flowers flesh-coloured, very beautiful; anthers purple, with the appendages yellow.

Choice Medinilla. Sh. 2 to 3 ft.

18 M. speciosa (Blum. l. c.) branches 4-sided; angles warty; leaves almost sessile, 4 in a whorl, rarely opposite, ovate-long, attenuated at both ends, or obtuse at the base, 7-9-nerved, rarely quintuple-nerved; panicles terminal and axillary, nodding; flowers octandrous or decandrous. Ῥ. S. Native of the interior of Java, in humid woods, rarely parasitical on trunks of old trees; and of the Moluccas. Melastoma eximium, Blum. bijdr. p. 1072. but not of Jack.

Shewy Medinilla. Sh. 2 to 3 ft.

19 M. intermedia (Blum. l. c. p. 516.) branches obliquely tetragonal; leaves almost sessile, opposite, elliptic-oblong, acute or acuminate, obtuse at the base, quintuple-nerved; panicles elongated, terminal; flowers octandrous. Ῥ. S. Native of Java, on Mount Gede, near Tjichanjar.

Intermediate Medinilla. Sh. 4 to 6 ft.

20 M. crispa (Blum. l. c. p. 517.) branches 4-sided; angles winged; leaves sessile, 4 in a whorl, oblong, narrow at the base, quintuple-nerved; cymes subcorymbose, axillary, and lateral from the falling of the leaves; flowers decandrous, rarely dodecandrous. Ῥ. S. Native of the Moluccas, in valleys and on the banks of rivers. Melastoma crispatum, Lin. spec. p. 560.—Rumph. amb. 5. p. 66. t. 55. f. 1. Flowers rather large. Fruit round, red.

Curled Medinilla. Sh. 4 to 6 ft.

Seet. III. Hypenia (from ἤνεις, hypene, a beard, and αὐθός, anthos, a flower; in reference to the flower-buds, which are beard with stellate down on the outside). Blum. bot. zeit. 1831. no. 30. p. 517. Tube of calyx obovate-oblong; limb short, 4-lobed. Petals trapeziform, alternate ones narrower than the others. Free part of the ovary clothed with stellate down. Seeds roughish.—A shrub, having its branches, peduncles, and leaves clothed with stellate tomentum, and with a different habit from the other species.

21 M. venosa (Blum. l. c. p. 518.) branches terete; leaves opposite, oval-oblong, those opposite each other usually of a different size, veiny, clothed with furfuraceous tomentum beneath, as well as on the branches; cymes pedunculate, terminal or lateral, involucrated by fuscaceous bracteae. Ῥ. S. Native of Java, on trees on Mount Ternate. Melastoma venosa, Blum. bijdr. p. 1075. Flowers middle-sized, octandrous, flesh-coloured; pedicels red.

Veiny-leaved Medinilla. Sh. 4 to 6 ft.

Seet. IV. Dactyloida (apparently derived from δακτύλος, 5 G

VOL. II.
MELASTOMACE. LV. PACHYCENTRIA. LVI. POGONANTHERA. LVII. ALLOMORPHA, &c.

**MELASTOMACE.**

**L. PACHYCENTRIA.** (from παχύς, pachys, thick, and κέντρον, kentron, a spur; in reference to the thick fleshy spur-like appendages of the anthers called connectives). Blum. in bot. zeit. 1831. no. 30. p. 519.

**Anthers.**—Terminal, constricted beneath the middle; limb oblong; opening by one pore at the apex, furnished at the base behind with a thick fleshy spur or connective each. Ovarium half adhering to the calyx, the free part conical and angular. Style filiform, furrowed, crowned by a small obtuse stigma. Berry globose, crowned by the constricted tube of the calyx, 4-celled. Seeds oval, smooth.—Smooth parasitical shrubs. Branches terete, but compressed at the ends, besprinkled with brown or dark purple dots, as well as the peduncles. Leaves opposite, petiolate, oblong, 3-nerved or somewhat triple-nerved, quite entire. Flowers in axillary and terminal corymbs, small, rose-coloured; pedicels subulate in the middle.

1 P. CONSTR. (Blum. l. c. p. 520.) leaves oval-oblong, bluntly acuminated, bluntish and rather corroded at the base; pedicels terminal or axillary, corymbose many-flowered.*

**Cult.**—Being parasitical shrubs the species had better be treated in the manner of parasitical orchideous plants. Their propagation is the same as that for Melastoma, p. 764. by cuttings.

**LVI. POGONANTHERA.** (from πόγων, pagon, a beard, and ανθέρα, anthera, an anther; in reference to the anthers being beard behind). Blum. in bot. zeit. 1831. no. 30. p. 520.

**Anthers.**—One or two spurious bristles, arising from the back at the base. Ovarium adnate to the calyx, with the free part conical. Style filiform, acutish. Capsule baccate, 4-celled. Seeds unknown.—Smooth Brazilian shrubs. Young branches compressed or tetragonal. Leaves petiolate, oval, or oblong, 3-nerved. Cymes terminal.

**Cult.**—For culture and propagation see Melastoma, p. 764.

**LVII. ALLOMORPHA.** (from ἀλος, alos, various, and μορφή, morphe, form; in habit in different situations). Blum. in bot. zeit. 1831. no. 30. p. 522.

**Anthers.**—One or two spurious bristles, arising from the back at the base. Ovarium adnate to the calyx, with the free part conical. Style filiform, acutish. Capsule baccate, 4-celled. Seeds unknown.—Smooth Brazilian shrubs. Young branches compressed or tetragonal. Leaves petiolate, oval, or oblong, 3-nerved. Cymes terminal.

**Cult.**—For culture and propagation see Melastoma, p. 764.

**LVIII. HUCERIA.** (dedicated by De Candolle to Francis Huber, author of mémoires sur l'influence de l'air dans la germination, 1 vol. 8vo, Geneva, 1801, and other works; and Peter Huber his son, author of a history of the Formica, and other insects.). D. C. prod. 3. p. 167.

**Anthers.**—One or two spurious bristles, arising from the back at the base. Ovarium adnate to the calyx, with the free part conical. Style filiform, acutish. Capsule baccate, 4-celled. Seeds unknown.—Smooth Brazilian shrubs. Young branches compressed or tetragonal. Leaves petiolate, oval, or oblong, 3-nerved. Cymes terminal.

**Cult.**—For culture and propagation see Melastoma, p. 764. by cuttings.

1 H. SEMISERRATA. (D. C. prod. 3. p. 167.) branches tetragonal; leaves lanceolate, acuminate, 3-nerved, quite entire at the base, serrated in the upper part; raceme simple, terminal; lobes of calyx lanceolate-linear, acute, hardly shorter than the 4-winged tube. *Native of Brazil, in the province of St. Paul, in marshes in woods. Rhéxia semisserrata, Schrank et Martin, Mess. Petals white, ovate, acuminate. Anthers yellow, equal in length with the filaments. Flowers an inch in diameter. Fruit unknown.

**Half-serrate.**—Leaved Hubertia. Sh. 4 to 6 feet.

2 H. LAUR. (D. C. l. c.) branches compressed; leaves oblong, quite entire, rather coriaceous, 3-nerved, lateral nerves almost marginal; cymes coriaceous, many-flowered; tube of calyx with 8 stripes, rather angular; fruit roundish; calyx permanent. *Native of Brazil. D. C. coll. mem. 1. t. 9. Melastoma latimatum, Ser. MSS. Leaves size and form of those
of *Laurus nobilis*, and at first sight apparently feather-nerved. The fruit is like that of a clove. Flowers white.

**Laurel-like Huberia.** Sh. 4 to 6 feet.

3 H. **ovatifolia** D. C. L. c.) branchlets rather compressed; leaves petiolate, oval, acute, quite entire, 3-nerved, besides the marginal nerves, which are hardly conspicuous; lateral nerves remote from the margin; cymes terminal, corymbose; calyx urceolate, elongated, canescent from rather flesky down; limb bluntly 4-lobed. *S*. Native of Brazil, where it was collected by Prince de Neuwied. Petals oblong-ovate, white, according to the dried specimens. Anthers furnished with a bristle-like spur, a little above the base on the back.

**Oval-leaved Huberia.** Sh. 3 to 6 feet.

§ 2. Anthers furnished with 2 bristles at the base, rising from the back.—These species probably do not properly belong to *Huberia*.—Maëta, Vent. choix. p. 32, but not of Aubl.

4 H. **Annuula** (Vent. choix. t. 32.) stem and branches terete, and a little striated; leaves lanceolate, cordate at the base, somewhat acuminate at the apex, petiolate, glabrous above, puberulous beneath; flowers disposed in panicled corymbs, axillary, few, octandrous; calyx tubular, rather compactulate, with 4 oblong segments, which are about the length of the tube. *S*. Native of Java. Maëta annulata, Vent. choix. t. 32. Petals obovate. Genital long than the corolla. Anthers large, acute, falcate. Style filiform, crowned by a stigma, which is hardly thicker. Berry 4-celled. **Annuulata Huberia.** Sh. 3 to 6 feet.

5 H. **Argentea** (D. C. prod. 3. p. 168.) branches from compressed to terete, clothed with brown furfuraceous scales; leaves oblong, attenuated at the base, obtuse at the apex, quite entire, 3-nerved, coriaceous, shining above, and covered with white furfuraceous scales beneath; peduncle terminal, coriaceous; flowers small, decandrous; calyx cup-shaped, 5-toothed, scurfy on the outside. *S*. Native of South America, near Santa Fé de Bogota. Petals 5, yellow. Berry 5-celled, at the size of a coriander seed. Maëta argentea, Vent. choix. p. 34. in a note.

**Silvery Huberia.** Sh.

**Cult.** For culture and propagation see *Melastoma*, p. 764.

**LIX. OCHTHOCHARIS** (from *ocho, ochlos, a river side, and phos, chairo, to delight in; inhabitants river banks*). Blum. in bot. zeit. 1831. no. 30. p. 523.

1 O. **Java*ica* (Blum. l. c. p. 553.) *S*. Native of the west of Java, at the river Panibang.

**Java Ochthocharis.** Sh. 3 to 6 feet.

**Cult.** For culture and propagation see *Melastoma*, p. 764.

**LX. CALYCOGONIUM** (from *kalke, kalke*, a calyx, and *gynos, gonia*, an angle; calyx angular). D. C. prod. 3. p. 168.—Calycopterus, Rich. herb. but not of Lam.

**Linn. syst.** Octo-Decandra, Monogynia. Tube of calyx subglobose, 4-5-gonal; angles acute, continuous with the middle nerve of the lobes, but rather acerate after flowering; lobes 4-5, spreading, oblong-linear, longer than the tube. Petals 4-5, ob-ovate. Stamens 8-10, equal; anthers oblong, opening by one pore at the apex, without any auricles at the base, and with the connectives hardly evident. Stigma dot-formed. Berry roundish, 4-5-angled, crowned by the lobes of the calyx, 4-5-celled. Seeds ovate, angular, with a linear hymen.—**Shrubs, natives of St. Domingo.** Branches terete, clothed with rufescents soft flesky stellate tormentum, as well as the pedicles and under side of the leaves. Leaves 3-5-nerved, on short pedicles, ovate-oblong, obtuse and rather coriaceous at the base, quite entire, glabrous above. Flowers 1-8 together, terminal, white, on short pedicels. Calyx beset with stellate down, appearing as if it were dotted.

1 C. **stellatum** (D. C. prod. 3. p. 168.) branches terete, and are, as well as the pediels and under side of the leaves, clothed with crowded white stellate down. *S*. Native of St. Domingo. Melastoma calycopterus, Rich. in *Bohn. mel. t. 45*. Melast. stellatum, Vahl. ined. Melast. scabrosum, Bert. in herb. Balb. Leaves 3-nerved, rarely somewhat 5-nerved, the 2 inner nerves rising a little above the base, and therefore the leaves are almost triple-nerved. Flowers 4 or 5 cleft in the same specimen.

**Silvery-haired Calycogonium.** Sh. 1 to 2 feet.

2 C. **glabrarium** (D. C. l. c.) branches nearly terete, glabrous; leaves petiolate, ovate, acuminate at both ends, somewhat rationally dentilicate, tripne-nerved, rather coriaceous, glabrous; pedicels terminal, 1-flowered, usually solitary, hardly longer than the pedicels; tube of calyx oblong, bluntly tetragonal, scabrous from stellate scattered down; lobes 4, subulate. *S*. Native of the south of Jamaica, on the high mountains. Melastoma glabrata, Swartz. fl. ind. occ. p. 806. Berry black, 4-celled, crowned by the calyx.

**Glabrous Calycogonium.** Sh. 1 to 2 feet.

**Cult.** For culture and propagation see *Melastoma*, p. 764.

**LXI. OSSÉA** (dedicated by De Candolle to Don Antonio de la Ossa, formerly director of the botanic garden at Havana, in Cuba). D. C. prod. 3. p. 168.

**Linn. syst.** Octandra, Monogynia. Tube of calyx ovate, adhering to the ovarium, but not drawn out beyond it; lobes 4, short, acute. Petals 4, lanceolate, acute. Stamens 8, short; anthers hardly auricled at the base. Ovarian smoothish at the apex. Style filiform; stigma simple. Berry 4-celled, crowned by the lobes of the calyx. Seeds ovate, angular.—American shrubs. Leaves 3-5-nerved. Flowers small, rising from the axis of the leaves, or from the old leaves.

* Flowers axillaris, sessile.

1 O. **sculpta** (D. C. prod. 3. p. 168.) branches terete, and are, as well as the pediels and nerves of leaves, scabrous from powdery branched rufous down; leaves petiolate, oblong, obtuse at the base, acutish at the apex, quite entire, 5-nerved, rather pilose; flowers on short pedicels, few together, axillary; calyx rather globose, covered with powdery grains; petals lanceolate, acuminate awned. *S*. Native of St. Domingo. Melastoma acutipetala, Rich. in *Bohn. melast. t. 38*. Melast. oxyptalamum, Spreng. syst. 3. p. 303. Maëta scolpia, Vent. choix. t. 33. Melast. gleomarata, Vahl. ined. Berry bluish, small, globose, 4-celled. Flowers small. Filaments of stamens broadish.

**Scalp Osséa.** Sh. 2 feet.

2 O. **scabrosa** (D. C. prod. 3. p. 169.) stem hairy; branches terete, hairy; leaves ovate, attenuated, dentilicate, 3-nerved, scabrous from papille, petiolar; flowers much crowded, sessile, octandrous; calyx hairy, 4-cleft; bind segments subulate 5 or 2.
and minute; petals 4, larger than the calyx, lanceolate, acute, white; filaments jointed; stigma blunt; berry minute, roundish, 4-celled, rufous. \( V \). S. Native of Jamaica, on the higher mountains. Melastoma scabrosa, Lin. spec. p. 558. Swartz, obs. p. 174.

Scabrous Ossea. Sh. 1 to 2 feet.

** Pedicels axillary or lateral, crowded, 1-flowered.

3 O. latersiplora (D. C. I. c.) glabrous; branches tetragonal, but at length terete; leaves petiole, obovate, acuminate, setaceous somewhat serrated, triple-nerved; pedicels aggregate, rising beneath the leaves, short, 1-flowered; calyx truncate, rather strigose; petals 4, ovate, attenuate. \( V \). S. Native of Montserrat, on the mountains. Melastoma latersiplora, Vahl. eel. Anthers oblong, obtuse. Stigma subcapitate. Berry globose, beset with scattered strigile.

Side-flowered Ossea. Sh. 1 to 2 feet.

4 O. sparsiplora (D. C. I. c.) branches nearly terete, and are, as well as the young leaves, rough from deciduous adpressed strigile when young, but as the strigile fall off, the parts soon become glabrous; leaves petiole, oval-oblong, acuminate at both ends, triple-nerved, with revolute margins; pedicels numerous, 1-flowered, short, rising in fascicles from the axils of the old leaves; calyx truncate; petals 4, lanceolate, acute. \( V \). S. Native of Guadaloupe, in woods on the mountains. Melastoma sparsiplora, Rich. herb. Flowers very small, acute, pale. Calyx dotted from small strigile.

Scattered-flowered Ossea. Sh. 3 to 6 feet.

5 O. flavescens (D. C. I. c.) branches bluntly tetragonal, nearly terete, scabrous from adpressed bristles when young, but at length becoming glabrous; leaves petiole, oval, acuminate at both ends, quintuple-nerved, crenulat, glabrous, except the nerves, which are bristly beneath; pedicels axillary, 1-flowered, short, quite glabrous, rising in fascicles from the axils of the old leaves; calyxes with repand margins; petals lanceolate, acute, rather velvety on the outside. \( V \). S. Native of French Guiana, in woods about Sincemari. Melastoma flavescens, Aubl. guian. 1. p. 528. t. 164. Leaves yellowish, smooth. Flowers small, white, agreeing in disposition to those of Loréya arboreescens.

Yellowish Ossea. Sh. 2 to 3 feet.

** ** Thryse axillary. In this section the anthers open by a broad almost 2-celled pore, and therefore nearly agreeing with the genus Cremánum.

6 O. multiflora (D. C. prod. 3. p. 169.) quite glabrous; branches bluntly tetragonal; leaves petiole, oblong, attenuated, blusnt, triple-nerved, with callos serrates; thryse axillary, shorter than the leaves; calyx campanulate, hardly 4-toothed; petals 4, oval, acute. \( V \). S. Native of St. Domingo. Melastoma multiflora, Desr. in Lam. dict. 4. p. 35. Rich. in Bonpl. mel. t. 31. Flowers small, white. Anthers obconical, opening in a bilabiate manner by a pore of 2 cells, which has a bicameralised dissepiment. Stigma dilated.

Many-flowered Ossea. Sh. 3 to 4 feet.

7 O. acuminata (D. C. I. c.) quite glabrous; branches tetragonally compressed; leaves petiole, oblong, tapering to both ends, very acute, with callos serrates, triple-nerved; thryse axillary, shorter than the leaves; calyx ovate, hardly 4-toothed; petals 4, lanceolate, acute. \( V \). S. Native of St. Domingo. Melastoma acuminata, Bert. ier. but not of Swartz. Very like O. multiflora, but is easily distinguished from that plant in the leaves and petals being acuminate.

Acuminated-leaved Ossea. Sh. 3 to 6 feet.

8 O. purpurascens (D. C. I. c.) quite glabrous; branches bluntly tetragonal; leaves petiole, oblong, tapering to the base and apex, triple-nerved, serrated; serratures small, ciliate; thryse axillary and lateral, tripartite; calyx minutely and acutely 4-toothed; petals 4, roundish. \( V \). S. Native of Jamaica, on the high mountains. Melastoma purpurascens, Swartz, fl. ind. occ. p. 804. Anthers obtuse, perforated at the apex. Stigma blunt, angular. Berry 4-celled.

Purple Ossea. Sh. 3 to 6 feet.

9 O. amygdalina (D. C. I. c.) quite glabrous; branches nearly terete; leaves petiole, lanceolate, attenuated at the base, acuminate at the apex, denticulated, triple-nerved; cymes loose, few-flowered, rising from the axis of the old leaves beneath the young leaves; calyx rather glabrous, bluntly 4-toothed; petals roundish. \( V \). S. Native of Porto Rico. Melastoma amygdalina, Desr. in Lam. dict. 4. p. 35. Rich. in Bonpl. mel. t. 36. where the description is good, but in the figure the berry is represented falsely as 3-celled. It hardly differs from O. purpurascens, unless in the calycine teeth being very obtuse.

Almond-like Ossea. Sh. 3 to 6 feet.

Cult. For culture and propagation see Melastoma, p. 704.

---

780 MELASTOMACEÆ. LXI. OSSÉA. LXII. SAGREÆ.

LXII. SAGRÆA (dedicated to Don Ramon de la Sagrè, of Havana, in Cuba, director of the Botanic Garden at Havana). D. C. prod. 3. p. 170.

L. s. Octandria. Monogynia. Tube of calyx-adhering to the ovary, but not drawn out beyond it; lobes 4, short, permanent. Petals 4, oval. Stamens 8; anthers hardly arched at the base. Ovary smooth at the apex. Style filiform; stigma obtuse. Capsule baccate, 4-celled. Seeds small, ovate-anglar.—American shrubs. Leaves 3-7-nerved. Flowers rising from the axils of the old leaves after they have fallen, as well as from the axils of those that are standing.

* Flowers crowded in the axils of the leaves, sessile, or on short pedicels.

1 S. columnneffólium (D. C. prod. 3. p. 170.) branches terete, and are, as well as both surfaces of leaves and calyces, very villosus; leaves nearly sessile, elliptic, blusnt, crenulat, 5-nerved; flowers axillary, sessile, in crowded whorls; calyx tubular, hairy, 4-toothed; petals oblong, obtuse. \( V \). S. Native of Peru. Melastoma columnnefolium, Schrank, mm. Very like the following species, but the leaves are almost obtuse, not acuminate, very hairy on both surfaces.

Columnnea-leaved Sagrea. Sh. 2 to 3 feet.

2 S. sessiiflóra (D. C. I. c.) branches terete, densely clothed with rufous hairs; leaves almost sessile, ovate, acuminate, crenulat, 7-nerved, ciliated, densely clothed with stiff hairs above, and with villi beneath; flowers almost sessile, crowded in the axils of the leaves; calyx cylindrical, tubular, hairy; petals oval, obtuse. \( V \). S. Native of Brazil and Guiana, in grassy meadows. The down and hairs on every part of the plant are simple, and somewhat incurved. Petals small, rose-coloured. Berry 4-celled. Seeds ovoid. Melastoma róbræ, Rich. in Bonpl. mel. t. 39. and perhaps the same as Melastoma róbræ. Aubl. guian. 1. p. 416. p. 161. but he says the flowers are decandrous, which is most probably wrong. Melast. sessiiflóra, Vahl. eel. amer. 1. p. 49. icon. amer. t. 18. Clidémia heteromólla, D. Don, in mem. wern. soc. 4. p. 310.

Sessile-flowered Sagrea. Sh. 1 to 2 ft.

3 S. fasciculáris (D. C. I. c.) branchlets tetragonal, hispid; petioles scabrous from hairs; leaves ovate, acute both at the base and apex, entire, 3-nerved, besides the 2 marginal nervules, scabrous from hairs, but with the nerves hispid on the under surface; pedicels short, 1-flowered, crowded beneath the leaves; teeth of calyx 4, acute, erect, permanent; petals roundish. \( V \). S. Native of the interior of Jamaica, in woods on the mountains. Melastoma fasciculáris, Swartz, fl. ind. occ. p.
SEHAIROTA (D. C. L. c.) branches nearly terete, and are as well as the pedicels hispid from long spreading bristles; leaves petiolate, broadly ovate, acuminate, 3-nerved, entire, pale beneath, and pilose on the nerves and margins; peduncles axillary, very short, 3-flowered; calyx very minutely 4-toothed; petals lanceolate, acuminate. *H. S. Native of Jamaica. Melastoma hirtella, Swartz, fl. ind. occ. p. 810. Anthers oblong and bifid, according to Swartz. Stigma obtuse. Berry 4-celled, hispid, dark purple. Seeds roundish.

**Hairy Melastoma.** Shrub 5 to 6 feet.

8 S. UMBROSA (D. C. L. c.) branches 4-furrowed, and are as well as the petals hispid from long spreading bristles; leaves petiolate, broadly ovate, acuminate, serrulate, ciliated, 5-7-nerved, very pilose on the nerves, the rest beset with scattered pili; petals axillary, loose, trichotomous, rather hispid, length of petals; calyx globose, hairy, with 4 short teeth; petals obovate. *H. S. Native of the West Indies, particularly in St. Christopher and Trinidad. Melastoma umbrosa, Swartz, fl. ind. occ. 817. Vahl. dec. amerc. 2. t. 29. There are varieties of this with hispid and very hispid branches, and middle-sized and large leaves. Berry globose, hairy, blackish, small, 4-celled. Petioles 1 and ½ inch long.

**Shaded Melastoma.** Shrub 3 to 6 feet.

9 S. BERTIERI (D. C. L. c.) branches terete, and are as well as the petioles, pedicels, and calyces densely clothed with loose spreading bristles; leaves ovate, obtuse at the base, acuminate at the apex, 5-7-nerved, serrulate, villous on both surfaces, but especially on the nerves; pedicels axillary, longer than the petioles, having their branches whorled; lobes of calyx 4, setaceous, rather longer than the tube. *H. S. Native of Jamaica. Melastoma umbrosum, Spreng, syst. 2. p. 304. but not of Swartz.

**Bertier's Melastoma.** Shrub 3 to 6 feet.

10 S. DOMINGOENSIS (D. C. L. c.) branches terete, and are as well as the petioles and peduncles clothed with short, simple, reflexed rather reflexed hairs; leaves petiolate, ovate, acuminate, serrulate, 5-nerved, most hairy on the nerves; pedicels axillary, trichotomous, a little longer than the petioles; tube of calyx rather globose, with 4 very short acute teeth. *H. S. Native of St. Domingo. Melastoma pileosum, Spreng, syst. 2. p. 304. Flowers small, white.

**St. Domingo Melastoma.** Shrub 3 to 6 feet.

11 S. TETRAGOSA (D. C. L. c.) branches acutely tetragonal, and are as well as the pedicels and peduncles clothed with rusty hairs; leaves petiolate, oblong, acute, 5-nerved, glabrous above and pilose beneath, but especially on the nerves; pedicels axillary, racemosae, twice the length of the petioles; calyx rather hairy, with a globose tube and 4 very short, acute teeth. *H. S. Native of Dominique, in woods. Flowers small.

**Tetragonal Melastoma.** Shrub 3 to 6 feet.

12 S. PILOSA (D. C. L. c.) branches terete, and are as well as the pedicels and peduncles clothed with rusty hairs; leaves petiolate, oblong, acute, 5-nerved, glabrous above and pilose beneath, but especially on the nerves; pedicels axillary, racemosae, trifid, bell-shaped; calyxes 4, very minute; petals roundish, reflexed. *H. S. Native of Jamaica, in woods on the mountains. Melastoma pilosa, Swartz, fl. ind. occ. p. 819. Petals small, white, spotted with red at the base. Berry hairy, roundish, 4-celled.

**Pilos Melastoma.** Shrub 5 to 6 feet.

13 S. MICROPHYLLA (D. C. L. c.) branches tetragonal, and are as well as the pedicels hairy; leaves ovate, on short petioles, obtuse, rather denticulated, hispid above, and clothed with rusty tomentum beneath, 3-nerved; peduncles axillary, trifid; calyx hairy, with 4 very short teeth. *H. S. Native of the south of Jamaica. Melastoma microphylla, Swartz, fl. ind. occ. p. 813. but not of Spreng. This species comes very near to S. hirsuta, but differs in the leaves being obtuse and smaller, in the flowers being smaller, in the pedicels being usually simple, and lastly in the berries being red, not dark purple.

**Small-leaved Melastoma.** Shrub 2 feet.

14 S. HIRSUTA (D. C. L. c.) branches terete, and are as well as the pedicels, petioles, and calyces beset with purplish, stiff hairs; leaves oblong-lanceolate, acuminate, denticulated, 3-nerved, very hairy on the nerves beneath, the rest beset with scattered pili; peduncles axillary, trifid; calyx ovate, with 4 linear teeth. *H. S. Native of the south off Jamaica, on the mountains. Melastoma hirsuta, Swartz, fl. ind. occ. p. 811. Petals ovate, acute, white, small. Berry dark purple, globose, hairy, 4-celled.

**Hairy Melastoma.** Shrub 2 feet.

15 S. RARIIFLORA (D. C. L. c.) branches terete, pubescent; leaves ovate, rather cordate, long-acuminate, petiolate, ciliated, usually 7-nerved; racemes axillary, few-flowered; flowers minute, octandrous: calyx pilose, with 4 very short teeth; petals ovate; style longer than the stamens; berry minute, globose, 3-celled. *H. S. Native of South America, in the province of Cumana, at Mount Caripe. Melastoma rariiflora, Bonpl. mel. t. 50. This is a doubtful species, from the flowers being described as octandrous; but in the figure the calyx is 5-lobed, and therefore the flowers would be decaduous. Flowers white.

**Few-flowered Melastoma.** Shrub 4 to 6 feet.

**Cult.** For culture and propagation see Melastoma, 764.
MELASTOMACEÆ.

LXIII. DISSOCHÆTA (from δισσός, dissós, double, and κάτε, a bristle; in reference to the connectives of the anthers being furnished with 2 bristles on their back, near the base). Blume, in bot. zeit. 1831, no. 28. p. 492.

Lin. syst. Octandria, Monogynia. Tube of calyx oblong, obscurely tetragonal, adhering to the ovarium; limb drawn out beyond the ovary, for the most part obliquely 4-toothed, permanent. Petals 4. Stamens 4, but sometimes 6; when this last is the case, the alternate ones are sterile. Anthers oblong-linear, opening by 1 pore, usually beaked and arched, rarely blunt and straight, furnished each with a lamellate, 2-awned, rarely undivided connate on the back, near the base. Style filiform, clavate. Stigma a pruinose dot. Berry elliptic-globose, nearly dry, crowned by the calyx, 4-celled, indesincent. Seeds cuneate, angular.—Sarmentose shrubs, with the branches, peduncles, and under side of leaves clothed with starry down, sometimes thickly and sometimes thinly, according to the species. Leaves petiolate, elliptic-oblong, quite entire, somewhat 5-nerved, glabrous above, for the most part of a different colour beneath. Inflorescence paniculate, terminal, or axillary. Flowers pale red, blue, or white. Habit of the genus Oxyporum.

SECT. I. DISSOCHÆTA (see genus for derivation). Blume. in bot. zeit. 1831. no. 28. p. 493. Limb of calyx cup-shaped, somewhat 4-toothed. Petals ovate-oblong, oblate, or oblong. Anthers fixed by the base or by the back. Connectives bifid or entire. Ovary minutely silky from stellate down at the apex.

* Flowers tetrandrous.

Falcacios Dissochæta. Sh. sarmentose.

2 D. INTERMÉDIA (Blum. l. c.) leaves 3-nerved, ovate-oblong, acuminate, somewhat cordate at the base, clothed with pale scarly ochraceous tomentum beneath; petioles terminal and axillary, much branched; calyx nearly quite entire; anthers fixed by the base, having their connectives ending in 2 bristles. ² S. Native of Java, in woods, on the chains of mountains called Pangarangih and Gegerbinting. Flowers white? Melastoma falka, Blume. Bijdr. p. 1068. ²ar. β; leaves clothed with rusty tomentum beneath; petioles loose. ² S. Native of Java, on the mountains of Mega Mendong and Puluh Sarie.

Intermediate Dissochæta. Shrub sarmentose.

3 D. MON'TCOLA (Blum. l. c. p. 494.) leaves like those of the preceding species; petioles terminal, simple, hardly branched. ² S. Native of Java, on the calcareous mountains of Kuriapan and Seribu.

Mountain-born Dissochæta. Shrub sarmentose.

4 D. LEPRÓSA (Blum. l. c. leaves 5-nerved, ovate-oblong, acuminate, somewhat cordate at the base, clothed with scurfy rusty tomentum beneath; petioles loose, axillary, and terminal; calyx 4-toothed; connectives of anthers furnished with 2 bristles each. ² S. Native of Java, on Mounts Salak and Gede. Melastoma leprous, Blume. Bijdr. p. 1068. Flowers larger than those of the preceding species.

Leprósa Dissochæta. Shrub sarmentose.

* * Flowers octandrous, with the alternate anthers sterile.

5 D. BRAC'TEATA (Blum. l. c. p. 495.) leaves 5-nerved, ovate, acuminate, cordate at the base, clothed with stellate down beneath; petals terminal; bracteas petiolate, ovate, membranous; calyx almost quite entire; connectives of anthers furnished with 2 bristles each. ² S. Native of Pulo Penang. Melastoma bracteatum, Jacq. in Lin. trans. 11. p. 9. Flowers pale rose-coloured.

Bracteata Dissochæta. Shrub sarmentose.

6 D. VÁ'CILLANS (Blum. l. c.) leaves 3-nerved, as well as with 2 marginal nerves, ovate-oblong, acuminate, rounded at the base, coriaceous, of the same colour on both surfaces, smoothish above, but with a little scattered, scurfy down beneath; petals terminal; calyxes quite entire; anthers straight, with their connectives furnished with 2 bristles each. ² S. Native of Java, in woods on the mountains of Seribu, in the province of Buitenzorg. Flowers rose-coloured, middle-sized.

Var. β; leaves narrower, and with longer taper points; flowers smaller and white. ² S. In woods, at the base of Mount Salak.

Vacillating-anthered Dissochæta. Shrub sarmentose.

7 D. FUSCA (Blum. in bot. zeit. 1831. no. 29. p. 497.) leaves 3-nerved, as well as with 2 marginal nerves, long-acuminated, rounded at the base, clothed with greenish brown, stellate, rather silky down beneath; petals terminal; calyx nearly quite entire; anthers falcate, having their connectives furnished with 2 bristles each. ² S. Native of Java, in woods on mountains of Salak and Gede. Melastoma fusca, var. Blume. Bijdr. 1074. var. γ. D. C. prod. 3. p. 130. Flowers small, rose-coloured.

Var. β, ferruginea (Blum. l. c.) leaves clothed with pale rusty stellate down beneath; petals axillary and terminal. ² S. Native of Java, in the province of Bantam.

Var. γ, obtuso-acuminata (Blum. l. c.) leaves terminated by a blunt acumen, clothed with scurfy down beneath. ² S. Native of Java, in the province of Buitenzorg, about Tjampia.

Fusca Dissochæta. Shrub sarmentose.

8 D. VELUTÍSINA (Blum. l. c.) leaves 3-nerved, as well as with 2 marginal nerves, elliptic-oblong, cuspitate, usually obliquely rounded at the base, clothed with stellate and simple ochraceous rather silky down beneath; petals axillary and terminal, rather corymbose; calyx almost quite entire; connectives of anthers furnished with 2 bristles each. ² S. Native of Java, in the province of Bantam. Panicle more contracted than in D. vacillans.

Velutina Dissochæta. Shrub sarmentose.

Slander Dissochæta. Shrub sarmentose.

10 D. INAPPENDICULÁTA (Blum. l. c. p. 499.) leaves 3-nerved, besides 2 marginal nerves, ovate-oblong, long-acuminated, rounded at the base, brownish-green beneath, and clothed with stellate scurfy pili; petals terminal; calyx almost quite entire; anthers fixed by the base, each furnished with a triangular, inappendiculate connective. ² S. Native of Java, in the western part. Melastoma vacillans, var. α, Blume. Bijdr. p. 1074. D. C. prod. 3. p. 150. Flowers rose-coloured, middle-sized.

Var. β, purpuráceus (Blum. l. c.) leaves densely beset with
MELASTOMACEÆ. LXIII. DISSOCHETA.

Cult. For culture and propagation see Melastoma, p. 761.

The species are all elegant when in flower.

LXIV. APLECTRUM. LXV. TETRAZYGIA.

in woods, on the higher mountains, where it is called by the natives Tjulun-jong-aray. Flowers as well as berries blue.

Blue-fruited Dissocheta. Shrub sarmentose.

LXIV. APLECTRUM (a, priv. and πλεκτρον, plectron, a spur; anthers without spurs or connectives). Blum. in bot. Zeit. 1831. no. 29, p. 502.

LXX. SYST. Oxyandra, Monogynia. Tube of calyx ovate-globose, adhering to the ovarium; limb drawn out beyond the ovary, truncate, or obsolete 4-toothed. Petals 4, ovate, or bluish. Stamens 8, the 4 alternate ones sterile. Anthers ovate, obtuse at both ends, opening by 1 pore at the apex, inappreciate at the base. Ovarium glabrous, crowned by 4 crests. Style filiform; stigma a pruinose dot. Berry nearly globose, crowned by the calyx, 4-celled, many-seeded. Seeds cuneiform.—Sarmentose smoothish shrubs, with the habit of Dissocheta. Leaves petiolate, elliptic-oblong, quite entire, 4-nerved. Inflorescence pinnate, axillary, and terminal. Flowers small, white.

1 A. viminalis (Blum. l. c.) leaves 5-nerved, cordate-oblong, or ovate, bluntly acuminate, clothed with stellate down beneath; panicles trichotomous, axillary, and terminal; bracteas oblong, ciliated; petals furnished with 1 or 2 bristles. S. Native of Java and Sumatra, in shady places. Melastoma viminalis, Jack. in Lin. trans. 14. p. 12. Flowers white.

Pale Dissocheta. Shrub sarmentose.

14. D. nemorósa; shrub clothed with rusty villi; leaves ovate-lanceolate, 5-nerved; peduncles axillary, usually solitary; stamens unequal; anthers sessile, furnished with 2 bristles at the base, and with fringed appendages in front; fruit 4-celled. S. Native of Sumatra and Pulo-Nias. Flowers large, fleshy-coloured.

Grove Dissocheta. Shrub 2 feet.

Sect. II. Diple'ctrum (from ἐίς, dis, twice, and πλεκτρον, plectron, a spur; in reference to the anthers being furnished with 2 anthers or 2 spurs behind). Blum. in bot. Zeit. 1831. no. 29, p. 501.

Leaves of calyx cylindrical, truncate, continuous with the tube. Anthers fixed by the base, curled in front, and furnished with 2 short anthers behind. Ovarium glabrous at the apex.

15. D. divaricatæ; leaves 3-nerved, ovate, acute, downy beneath, glabrous and shining in front; branches clothed with rusty tomentum; panicles terminal, divaricate; calyx urceolate, truncate, and is as well as the peduncles tomentose; anthers almost sessile. S. Native of the East Indies. Melastoma divaricatum, Willd. spec. 2. p. 596. Berry about the size of a grain of pepper.

Divaricate-paniced Dissocheta. Shrub sarmentose.

16. D. glau'ca (Blum. in bot. Zeit. 1831. no. 29, p. 501.) leaves 3-nerved, besides the 2 marginal nerves, oblong, cor- date, bluntly acuminate, clothed with scurfy, stellate down beneath as well as the branches, and panicles which are terminal; stamens 6-8, 4 of which are only fertile. S. Native of Pulo-Penang and of Java. Melastoma glauca, Jack. in Lin. trans. 14. p. 15. Flowers pale blue.

Glaucous Dissocheta. Shrub sarmentose.

17. D. cyanoca'ra (Blum. l. c.) branchlets and petals beset with scattered simple bristles; leaves 3-nerved, besides the 2 marginal nerves, ovate-oblong, acuminated, coriaceae at the base; stamens 8, the 4 alternate ones barren. S. Native of Java.
with small, lepidopterous down beneath as well as on the peduncles and calyces; thyrses panicled, many-flowered. ♀ S. Native of Jamaica, on the highest mountains, and of Guadaloupe. Melastoma tetrandra, Swartz, fl. ind. occ. p. 795, but not M. tetrandrum of Spreng. syst. Flowers small, white, tetrandrous.

**Tetrandrous Tetrazygia.** Shrub 3 to 6 feet.

**sect. II. Octostemon** (from *octo*, eight, and *stema*, a stamen; stamens 8). D. C. prod. 3. p. 172. Stamens 8. Thyrses corymb-form.

2 T. Diiscolor (D. C. prod. 3. p. 172.) branches bluntly tetragonal; petioles, panicules, and under side of leaves clothed with hicky, short, white, stellate down; leaves repandely denticulated, oval, acuminate, 5-nerved; glabrous above; cyme paniculately corymbose, trichotomous, terminal; teeth of calyx short, obtuse; petals oval, retuse. ♀ S. Native of the West Indies, Guadaloupe, Martinico, St. Vincent, Mont Serrat, &c. Melastoma discolor, Lin. spec. p. 560. Jacq. amer. t. 130. f. 84. Rich. in Bonpl. mel. t. 34. Melast. acuminata, Vahl. ecle. t. 1. t. 7. Melast. elegnoides, Sieb. fl. trin. no. 61. Flowers cream-coloured.

**Two-coloured-leaved Tetrazygia.** Shrub 4 to 6 feet.

3 T. Elegnoides (D. C. l. c.) branches nearly terete, and are as well as the petioles and under side of leaves clothed with adpressed, rufescent, lepidopterous, rather powdery down; leaves oblong, 3-nerved, attenuated at both ends, glabrous above, rather coriaceous; cymes twice trifid, terminal; limb of calyx urceolate, obscurely 4-toothed. ♀ S. Native of the West Indies. Melastoma elegnoides, Swartz, fl. ind. occ. p. 815. Vahl. icon. pl. amer. 2. t. 28. Rich. in Bonpl. rhex. t. 13. Petals white, oblong. Berries bluish black, bottle-shaped, from being crowned by the permanent neck of the calyx.

**Elegnoides-like Tetrazygia.** Shrub 3 to 10 feet.

4 T. Angustifolia (D. C. l. c.) branches terete and are, as well as the petioles and under side of leaves clothed with velvety, minute, stellate down; leaves linear-lanceolate, with revolute, quite entire margins, 3-nerved, beset with yellowish dots above; lateral nerves approaching the margin of leaf; cymes paniculately corymbose, trichotomous; calyx rather globose, with the limb slightly 4-toothed. ♀ S. Native of the West Indies, particularly of Montserrat, Trinidad, Guadaloupe, &c. Melastoma angustifolia, Swartz, fl. ind. occ. p. 799. Rich. in Bonpl. mel. t. 10. Vahl. dec. amer. 3. t. 26. Petals from white to pale red, obvate. Flowers one-half smaller than those of T. elegnoides. Fruit nearly globose, not bottle-shaped.

**Narrow-leaved Tetrazygia.** Shrub 3 to 6 feet.

5 T. Crotonifolia (D. C. l. c.) branches terete, hispid; leaves sissile, cordate, lanceolate, dentilicate, 5-nerved, glabrous above, and rather muricated, clothed with white down oromentum beneath; panicles terminal, few-floowered; calyx rather campanulate, 4-toothed. ♀ S. Native of St. Domingo. Melast. crotonifolia, Desr. in Lam. dict. 4. p. 43. Petals 4, oval, purple. Fruit ovate, glabrous, crowned by the calyx. The habitat of the plant is between that of Heterotrichium and Tetrazygia.

**Croton-leaved Tetrazygia.** Shrub 3 to 6 feet.

**Cult.** See *Melastoma* for culture and propagation, p. 764.

**LXVI. HETEROTRICHUM** (from *trepæ*, heteros, variable, and 2ξ τριχος, thrix trichos, a hair; the plants are clothed with variable hairs, some stellate and soft, and others simple and bristly intermixed). D. C. prod. 3. p. 173.

**Lin. Syst.** Decca-locandra, Monogaynia. Tube of calyx ovate-globose; limb 5-6-cleft, with the lobes permanent and broad at the base, and elongated and subulate at the apex. Petals 5-8, oval. Stamens 12-16, equal; filaments glabrous; anthers oblong, hardly gibbose at the base, opening by one pore at the apex. Ovarium gibbose, umbilicate at the apex. Style cylindrical; stigma a prominent dot. Capsule bacate, 5-6-celled, globose, crowned by the calyx. Seeds unknown. —Shrubs, natives of St. Domingo. Branches terete, and are, as well as the petioles, panicules, and calyces beset with stiff bristles and stellate down intermixed. Leaves petiolate, bristly above, and hispid on the nerves beneath, but velvety between the nerves. Cymes terminal, trichotomous, umbellate. Flowers white or purple. The torus in *H. octonum* is easily separated from the calyx, forming a tuine around the ovarium, toothed at the apex. Perhaps in all.

1 H. Angustifolium (D. C. prod. 3. p. 173.) branches, petioles, and peduncles, as well as under side of leaves and calyces, clothed with short stellate white tomentum, intermixed with stiff rubious spreading bristles; leaves oblong, obtuse at the base, acuminated at the apex, rugosely crenulated, beset with bristles on the upper surface, which are tumid at the base, triple-nerved; cymes divaricate, trichotomous, terminal; tube of calyx ovate, having the lobes of the limb dilated and rounded at the base, and ending each in a subulate manner. ♀ S. Native of St. Domingo and Martinique. Melastoma hirta, Desr. in Lam. dict. 4. p. 43, but not of others. Melast. Berteroanum, Ser. mas. (Plum. ed. Burk. t. 141). Perhaps the same as Melast. pallens of Spreng. syst. Petals ovate, acutish. Anthers oblong, bluntly subgibbose at the base. Axes of nerves bearded.

**Narrow-leaved Heterotrichium.** Sh. 3 to 6 feet.

2 H. Pyrum (D. C. l. c.) branches, petioles, pedicels, and under side of leaves, beset with blackish rigid bristles, intermixed with white stellate down; leaves cordate, acuminated, scabrous from bristles above, 7-nerved; paniéle loose; flowers 6-cleft. ♀ S. Native of St. Domingo. Melastoma nivea, Desr. in Lam. dict. 4. p. 42. Very nearly allied to the following species, but differs in the down being white, as in the preceding species, and in the flowers being 6-cleft and dodecandrous.

**White Heterotrichium.** Sh. 6 to 8 feet.

3 H. Patens (D. C. l. c.) branches, petioles, peduncles, and calyces, beset with glandular bristles, intermixed with stellate down; leaves cordate, acuminated, somewhat dentilicate, 7-nerved, rather scabrous above, but clothed with white velvety down beneath; cymes terminal, loose; flowers 6-8-cleft; lobes of calyx spreading. ♀ S. Native of St. Domingo. Melastoma pætnæ, Swartz, fl. ind. occ. 2. p. 791. Melast. lappacæa, Desr. in Lam. dict. 4. p. 42. Melast. grandiforum, Spreng. in herb. Balb. but not of Anabl. Flowers pale red or whitish. Berry sweet, but insipid.

**Spreading Heterotrichium.** Shrub 6 feet.

4 H. Octum (D. C. l. c.) branches, petioles, and peduncules beset with long, spreading, reflexed bristles, intermixed with short, stellate down; leaves cordate, acuminated, 5-7-nerved, hispid above from simple, toothed bristles, but clothed with stellate down beneath; thyrase panicled, terminal; teeth of calyx 8, subulate, short, permanent, incurved. ♀ S. Native of South America, on Mount Quindiu, near the river Guada. Melastoma octóma, Bonpl. mel. t. 4. Petals 4, white. Torus separable from the calyx, forming an 8-toothed tunic around the ovarium.

**Eight-cleft-calyxed Heterotrichium.** Sh. 6 to 9 feet.

5 H. Novemserium (D. C. l. c.) branches, petioles, and peduncules beset with glandular bristles, intermixed with grey stellate tomentum; leaves ovate, rather cordate at the base, acuminated at the apex, ciliately serrulata, 9-nerved, rough from blisters above, and velvety beneath from white stellate down; thyrase panicled, loose, terminal; calyx clothed with white tomentum, having 5, erectish lobes. ♀ S. Native of Brazil. Petals oblong.
Nine-nerved-leaved Heterotrichum. Sh. 6 feet.

Cult. For culture and propagation see Melastoma, p. 764.

LXVII. CONOSTEGIA.

(from κωτός, κονος, a cone, and στεγή, a covering; in reference to the conical calyx falling off in one piece). D. Don, in mem. soc. wern. 4. p. 318. See mss. D. C. prod. 3. p. 173.—Melastoma calyptrata, Bonpl. mel.—Calycotomus and Bruguiera, Rich. ined.

Lax, syr. Deca-leaved, Monogyenia. Tube of calyx adnate to the ovary; limb undivided, conical, form of a calyptra, cut round (f. 112. b.), or irregularly ruptured at the base through activation, and therefore falling off in one piece (f. 112. a.).

Sect. I. Ericostégia (from ερωτ, erion, wool, and στεγή, stegē, a covering; calyx woolly). Flower-bud globose, hispid, abruptly acuminate.

1 C. Mutisi (Ser. mss. ex D. C. prod. 3. p. 174.) branches, petals, peduncles, and calyces hairy; leaves large, cordate-oval, rather acuminate, denticulated, 7-9-nerved, glabrous above, but rather pilose on the nerves beneath; peduncles terminal, usually 3-flowered; flower-bud ovate-globose, abruptly acuminate, and regularly cut round at the base. S. Native of South America, on Mount Quindiu, at the altitude of 2500 feet. Melastoma Mutisi, Bonpl. mel. 1. p. 136. t. 58. Calyx large, hairy. Bracteas linear-subulate. Petals 5, white, oval. The flowers are said to be polyandrous in the character given by Bonpland, and decandrous in the French description. Stigma simple.

Mutis’s Conostegia. Tree 20 feet.

Sect. II. Euconostégia (this section contains what are supposed to be the true species of the genus). Flower-bud ovate, blunt at the apex or acutish, glabrous or a little velvety.

2 C. Extinctoria (D. Don, in mem. soc. wern. 4. p. 316.) branches bluntly tetragonal, rather terete, and are, as well as the petioles, leaves, and panicles, clothed with adpressed rusty down; leaves oval-oblong, long-acuminated, quintuple-nerved, with repandly denticulated margins, glabrous and shining above; panicle terminal; flower-bud ovate-globose, abruptly acuminate, and regularly cut round about the middle. S. Native of New Granada, in temperate places near Mariquita. Melastoma extinctorium, Bonpl. mel. t. 57. Petals 6, obovate, white. Stamens 20. Berry 5-celled.

Spoiled Conostegia. Tree 24 feet.

3 C. d’escolor (D. C. prod. 3. p. 174.) branches nearly terete, and are, as well as the petioles, peduncles, and under side of leaves, clothed with short rusty down; leaves oval, attenuated at the base, acuminate at the apex, quite entire, 5-nerved, besides the marginal nerves; thyrse terminal, pilose, loose; calyx glabrous after opening, urceolate, truncate, globose at the base. S. Native of St. Domingo. Melastoma tetrandrum, Spreng. syl. 2. p. 305. exclusive of the synonyms.

Two-coloured-leaved Conostegia. Tree 12 to 20 feet.

4 C. próscura (D. Don, l. c.) glabrous; branches bluntly tetragonal; leaves oval-lanceolate, acuminate, entire, triple-nerved, bearded in the axils of the nerves beneath; thyrse panicled, terminal, loose; flower-bud ovate, acuminate, cut round in the middle. S. Native of Jamaica, on the mountains. Melast. próscara, Swartz, fl. ind. occ. p. 784. Bonpl. mel. t. 51. Perhaps Swartz’s plant under this name is the same as Bonpland’s, although Swartz says the leaves of his plant are glabrous, and sometimes rusty beneath, the stigmas capitulate, and the flowers deciduous; Bonpland says, his plant has dodecandrous flowers, nerves of leaves bearded, and an acute stigma. Flowers white.

(F. 112. a.)

Tall Conostegia. Tree 12 to 30 feet.

5 C. Baelisa’na (Ser. mss. ex D. C. prod. 3. p. 174.) quite glabrous; branches bluntly tetragonal; leaves oval, rather oblong, hardly acuminate, quite entire, triple-nerved, besides the marginal nerves; thyrse panicled, terminal, elongated, having its branches 3-flowered; flower-bud ovate, acutish, at length cut round about. S. Native of Jamaica. Flowers twice the size of those of C. calyptrata. Perhaps the same as Melastoma próscara, Swartz, but not of Bonpl. Base of calyx campanulate, rather urceolate, truncate. Stamens 12. Style not thickened at the apex. Berry 8-celled.

Baldis’s Conostegia. Tree 20 feet.

6 C. subhisu’ta (D. C. prod. 3. p. 174.) branches tetragonal, and are, as well as the petioles and nerves of leaves, densely clothed with rusty branched down; leaves oval, somewhat attenuated at the base, abruptly acuminate at the apex, quite entire, 5-nerved, glabrous on both surfaces, except the nerves on the under surface; thyrse panicled, terminal, few-flowered; calyx ovate, after separating hemispherical truncate and glabrous at the base. S. Native of Cuba, for the Havana, and of Guadaloupe, Bruguiera, Rich. herb. This species is very distinct in the hairiness, form of the leaves and calyces. Petals 8-10, obovate-oblong. Berry 12-celled. Stigma peltate.

Rather-hairy Conostegia. Tree 20 feet.

7 C. calyp’trata (D. Don, l. c.) smoothish; branches tetragonal, and are, as well as the petioles, panicles, and nerves of leaves on the under side, clothed with scurfy down; leaves on long petioles, oval-oblong, long-acuminated, glabrous above, somewhat denticulated, 3-nerved, besides the 2 small lateral nerves; thyrse panicled, terminal, loose; flower-bud ovate, obtuse at the base, rather acutish at the apex, sometimes cut round about in the middle. S. Native of mountain woods in Guadaloupe, Martinique, and Montserrat, &c. Melastoma calyptrata, Desr. in Lam. dict. 4. p. 51. Rich. in Bonpl. mel. t. 46. Vahl. c. 1. p. 40. Flowers white.

Calyptrate-calypxed Conostegia. Sh. 6 to 8 feet.

8 C. cornif’olia (Ser. mss. ex D. C. prod. 3. p. 175.) quite glabrous; branches nearly terete; leaves petiolate, oval, short-acuminated, quite entire, 3-nerved, besides the marginal nerves; thyrse panicled, terminal, loose; flower-bud ovate, obtuse at the base, rather acutish at the apex, sometimes cut round about in the middle, and sometimes opening irregularly by 2 valves. S. Native of Martinique. There is a small-leaved variety found on the mountains, and a large-leaved variety in the woods. Melastoma cornifolia, Desr. in Lam. dict. 4. p. 51. Rich. in Bonpl. mel. t. 41. Melast. picta, Vahl. c. 3. p. 15. ex Ser. Petals 5, white, obtuse. Stamens 10. Berry 4-celled.

Dag-wood-leaved Conostegia. Tree 20 feet.

9 C. semicren’ata (Ser. mss. ex D. C. prod. 3. p. 175.) glabrous; branches nearly terete; leaves oblong, long-acuminated, repandly crenated in the upper part, 3-nerved, rusty beneath in the adult state; thyrse panicled, terminal, loose; flower-bud ovate, attenuated at the base, acutish at the apex; tube of calyx 5 H.
a little striated, with a circumscribed or irregularly ruptured limb.  

11. C. Parytheca (C. D. l. c.) glabrous; branches terete; leaves oval-lanceolate, acuminated at both ends, quite entire, double-nerved, besides the marginal nerves; thyrse panicked, terminal, short; flower-bud ovate, irregularly ruptured; ½ S. Native of Peru, on the Andes. Melastoma parytheca, Bonpl. mel. t. 20. Petals 5, white, ovate. Anthers not protruded at the base. Berry 3-nerved.

Small-leaved Conostegia. Shrub 6 ft.

12. C. montana (D. Don, l. c.) smoothish; branches tetragonal, clothed with mealy cinnereous down; leaves oblong, somewhat denticulated, 3-nerved, besides the marginal nerves, paler beneath; thyrse panicked, terminal, having its branches spreading; flower-bud ovate-oblong, obtuse, irregularly ruptured. ½ S. Native of the temperate parts of Mexico. Melastoma montana, Bonpl. mel. t. 55. Petals 5, white, ovate. Stamens 10; stigma obtuse. Berry 3-nerved.

Mexican Conostegia. Shrub 6 ft.

13. C. Xalapensis (D. Don, l. c.) branches terete, and are, as well as the petals, panicled, and under side of leaves, clothed with rusty down; leaves lanceolate, acute at both ends, quin-

yte-nerved, toothed; thyrse terminal, panicked, ovate; flower-bud ovate-oblong, obtuse at both ends, regularly cut round about in the middle. ½ S. Native of Mexico, near Xalapa. Melastoma Xalapensis, Bonpl. mel. t. 54. Petals 5, oval, white. Stamens 10; stigma obtuse.

Xalapa Conostegia. Shrub 5 feet.

14. C. Lutea (Ser. ex D. C. l. c.) branches quite glabrous, obscurely tetragonal above; leaves ovate-lanceolate, attenuated, glabrous, a little toothed on the outer margin, petio-

late, 3-nerved; racemes terminal, compound; flowers decanan-

drous; peduncles 3-flowered, the middle flower of the three sessile: calyx ovate, acute, at length truncate; style brownish purple, longer than the corolla and stamens. ½ S. Native of the Island of Montserrat. Melastoma lutea, Bonpl. vell. fasc. 3. p. 17, but not of Hum. et Bonpl.

Yellowish Conostegia. Shrub 2 to 3 feet.

15. C. glabra (D. Don, l. c.) branches nearly terete; leaves oblong, acuminated, somewhat 3-nerved, quite entire, glabrous; panicle terminal; calyx circumscribed. ½ S. Native of the Society Islands. Melastoma glabra, Forst. prod. no. 194. Wildl. spec. 2. p. 584. The whole shrub quite glabrous, the branches purplish, the leaves almost one-nerved, from the marginal nerves being confluent. Cymes corymbose, terminal, trichotonous. Flower-bud obovate, obtuse.

Glabrous Conostegia. Shrub 4 to 6 ft.

† Species not described.

17. C. Holosericea (D. Don, mem. soc. wern. 4. p. 316.) ½ S. Native of Peru. Melastoma holosericea, Pav. in herb. Lamb, but not of Lin.

Whole-silky Conostegia. Shrub.

18. C. cucullata (D. Don, l. c.) ½ S. Native of Peru. Melastoma cucullata, Pav. in herb. Lamb.

Cucullata Conostegia. Shrub.

Cult. For culture and propagation see Melastoma, p. 764.

LXVIII. DIPLOGENEA. LXXIX. Diplochita.

LXXIX. DIPLOCHITA (from orth, diploa, double, and chiton, chiton, an outer covering; in reference to the calyx, which is involved by 2 bracteas while in a young state). D. C. prod. 3. p. 176. - Chitonæa, D. Don, in mem. wern. soc. 4. p. 317, but not of Mocino. - Forthergilla, Aubl. guian. 1. p. 441, but not of Lin.

LIN. SYST. Deca-Dodecandria, Monogynia. Calyx with a calyptriform conical deciduous limb. Petals 4, lanceolate, inserted in the fleshy disk which covers the ovarium; anthers ovate, bical- 

ecare at the base, opening by one pore at the apex. Ovarium adnate to the calyx, 4-celled, many seeded, crowned by the large fleshy disk. Style falcate, clavate. Stigma simple. - A smooth parasitical shrub, almost with the habit of Viscus. Leaves fleshy, dichotomous, compressed in the young state. Leaves oblong, retuse, fleshy, 3-ribbed, veinless, filled with oily receptacles between the parenchyma. Flowers small, white, disposed in short axillary racemes. Tube of calyx replete with oily receptacles.

1. C. viscoïdes (Lindl. l. c.) ½ S. Native of Madagascar at St. Mary’s.

Misseltoe-like Diplogena. Shrub.

Cult. This plant being parasitical, it should be treated in the same manner as tropical orchideous plants. Cuttings will strike root under a hand-glass.

LXXIX. DIPLOCHITA (from orth, diploa, double, and chiton, chiton, an outer covering; in reference to the calyx, which is involved by 2 bracteas while in a young state). D. C. prod. 3. p. 176. - Chitonæa, D. Don, in mem. wern. soc. 4. p. 317, but not of Mocino. - Forthergilla, Aubl. guian. 1. p. 441, but not of Lin.

LIN. SYST. Deca-Dodecandria, Monogynia. Calyx adhering to the ovatum at the base, when young involved by 2 bracteas, cylindrical, with the throat usually ciliated after flowering; limb bluntly 5-6-toothed, permanent, drawn out beyond the ovarium. Petals 5-6, usually oblong. Anthers biariculate at the base, opening by one pore at the apex. Ovarium ovate-oblong, crowned by a calloose glabrous disk. Style filiform; stigma petalate or capitulate. Capsule dry, indehiscent, 5-celled. Seeds ovate. - Tall South American showy trees or large shrubs, usually clothed with rusty velvety down on the branches, and under side of the leaves. Leaves petiolate, ovate, usually acu-

minated, obtuse or cordate at the base, smoothish above, with the margins quite entire or crenated. Thyre terminal, with opposite branches. Flowers white or rose-coloured, but in one of the species yellow. Bracteas 2, oval, large, involving the calyx when young, but at length falling off altogether.

* Leaves quite entire.

1. D. Fothergilla (D. C. prod. 3. p. 176.) branches compressed when young, but at length becoming terete, and are, as well as the petioles, rachis, and nerves of leaves on the under side, clothed with rufous down; leaves petiolate, oval, acumi-
Flowers, Leaves, and other parts of flowers, Native to South America.

**Flower:**
- Simple, solitary or in small clusters, usually showy.
- petals: 5, distinct, unequal, often unequal in size and shape.
- stamens: numerous, filaments sometimes varying in length.
- carpels: usually many, united into a single ovary, often with a single style and stigma.
- pollen: generally globular, yellow or white.

**Leaf:**
- Simple, alternate or opposite, usually entire or toothed, sometimes divided into leaflets.
- petiole: usually present, sometimes absent.
- base: various, from heart-shaped to pointed.

**Fruit:**
- Capsule: dry, splitting, containing numerous seeds.
- Seed: small, usually flat or oblong, with a hard, smooth coat.

**Additional Info:**
- Some species are used medicinally or as ornamentals.
- Habitat: mainly found in tropical and subtropical regions.
- Cultural notes: Some species are easy to grow in temperate regions with the right conditions.

**References:**
- Fothergilla's Diplochita. Clt. 1815. Tree to 10 to 20 feet.
- Melastoma mucronata (D. C. pro. 3. p. 177.) branches somewhat compressed, at length terete, and are, as well as the petals, peduncles, and under side of leaves, densely clothed with rus with whitish brown, adpressed, fleshy, stellate down; leaves petiole, ovate, acuminate, oblong at the base, with the margins quite entire, glabrous on the upper surface; petals terminal, and there are also racemose peduncles rising from the axis of the upper leaves; calyx tubular, not striated; petals glabrous. h. S. Native of Brazil, near Coari, in marshy fields. Melastoma bracteatum, Mart. et Schrank, mss. Like D. Fothergilla, but differs in the margins of the leaves being quite entire, in the calyxes being tomentose, and in the stigmas not being dilated.

**Key Species:**
- *Fothergilla diaphora* (from φθοργίλα, phylon, a leaf, and ποτες, potes, a foot; the pedicels or footstalks bear two leafy bracteas each). D. C. prod. 3. p. 177.

**Cult:**
- All the species are fine broad leaved trees and shrubs. Their culture and propagation are the same as for the species of Melastoma. p. 764.
calyx. Style cylindrical, rather velvety at the base. Stigma a prominent dot. Fruit probably baccate, 5-celled. Seeds unknown.—Brazilian shrubs, having the younger branchlets and petioles clothed with rufous adpressed bristles, but at length becoming smooth. Leaves oblong, elongated, acuminate, 3-nerved, quite entire, with a few scattered bristles above, but covered with pale rufous stellate down beneath. Pedicels axillary, 1-flowered, a little longer than the petioles, bearing 2 linear foliaceous bracteae above the middle. Calyx very hirsut. Petals purple.

1 P. Martírii (D. C. prod. 5. p. 178.) η. S. Native of Brazil at Coari, and at Cupati in the province of Rio Negro, in fields. Melastoma phyllopus, Schr. et Mart. mss. Leaves 5-6 inches long, and 1 broad.

Martins's Phyllopus. Shrub.

Cult. For culture and propagation see Melastoma, p. 764.

LXXI. HENRIETTEA (Caca-Henriettea is the name given to the tree by the natives of Cayenne). D. C. prod. 3. p. 178.

Linn. syst. Decandra, Monogynia. Calyx campanulate, 5-lobed; lobes broad, obtuse. Petals 5, velvety, ovate. Stamens 10; anthers club-shaped, bilobed, and ending in a beak at the apex opening by one pore. Style cylindrical, hairy, crowned by an obtuse capitate stigma. Berry juicy, 5-celled. Seeds unknown.—Shrubs, native of Guiana, with nearly terete branches, clothed with adpressed stigmate down. Leaves on short petioles, oval, acuminate by a mucron, triple-nerved, green above, and clothed with velvety down beneath. Peduncles 1-flowered, rising, 3-4 together, from the axis of the fallen leaves. Calyx clothed with rufous villi.

1 H. succosa (D. C. prod. 3. p. 178.) branches bluntly tetragonal, but at length becoming terete, and are as well as the petioles rough from adpressed stigmate down; leaves on short petioles, quintuple-nerved, oval, acuminate by a mucron, quite entire, green above, hairy on the nerves, but the rest of leaf scabrous from stiff bristles, and clothed with roughish rusty down beneath; pedicels 3-4 together, 1-flowered, in the axis of the fallen leaves, rusty; calyx rusty, villous, bluntly 5-lobed. η. S. Native of Cayenne, in woods, where it is called by the inhabitants Caca-Henriettea. Melastoma sucesa, Aubl. guian. 1. p. 418. t. 163. Calyx obovate-globose. Petals large, ovate, velvety. Anthers large, obtuse and biauriculate at the base, but tapering into a 1-lobed beak at the apex. Style thick, hardly capitate at the apex. Berry violaceous, but with the pulp red.

Juicy-barberry Henriettea. Shrub 10 to 12 feet. 

† Doubtful species.

2 H. ? Patricia (D. C. I. c.) branches nearly terete, and are as well as the petioles and nerves of leaves scabrous from adpressed, reddish strigil; leaves petiolate, oval, obtuse at the base, acute at the apex, ciliated with bristles, triple-nerved, besides the 2 marginal nerves, glabrous on both surfaces, except on the nerves; pedicels crowded in the axis of the old or fallen leaves, very short, 1-flowered, and are as well as the calyces clothed with adpressed, rufous down; limb of calyx bluntly 5-lobed; petals lanceolate. η. S. Native of Cayenne. Leaves 3 inches long. Flowers small, almost sessile. Adult branches glabrous. Style filiform. Stamens not seen. Berry glabrous, globose. Limb of calyx permanent, incurved.

Patris's Henriettea. Shrub 6 to 10 ft. 

3 H. ? Ramifòra (D. C. I. c.) branches bluntly tetragonal, hispid, but at length becoming glabrous; leaves on short petioles, ovate-lanceolate, acuminate at both ends, entire, 3-nerved, besides the 2 marginal nerves, smooth above, but clothed with roughish rather rusty tomentum beneath; pedicels scattered on the branches beneath the leaves, rather crowded, 1-flowered; calyx urceolate, bluntly 5-toothed; petals ovate. η. S. Native of Jamaica, in marshes. Melastoma raniiflora, Swartz, fl. ind. occ. p. 775. Flowers flesh-coloured. Anthers sagittate, acuminate. Stigma blunt. Leaves of a golden yellow hue above.

Branch-flowered Henriettea. Shrub 6 to 10 feet.

Cult. For culture and propagation see Melastoma, p. 764.

LXXI. MARUMIA (in honour of the celebrated vegetable physiologist, Martin Van Marum, author of Dissertationes quae disquiritur quo usque motus fluidorum animalium et plantarum consentient, 4to. Groningen, 1773, and other works). Blum. in bot. zeit. 1831. no. 29. p. 503.

Linn. syst. Octandra, Monogynia. Tube of calyx oblong-ovate, adhering to the base to the ovary, beset with stiff hairs; limb 4-cleft, drawn out beyond the ovary, with the segments oblong-linear and permanent. Petals 4, unequal. Stamens 6, alternate ones shorter; anthers linear, arching, beaked at the apex, and opening by 1 pore, those of the longer stamens constricted at the base, and furnished with a fascicle of bristles; and those of the shorter ones furnished with fewer bristles at the base. Ovary conical in the free part and rather villous. Style filiform, thickish at the base. Stigma a clanny dot. Berry ovate, inclosed in the calyx, 4-celled, many-seeded. Seeds linear-cuneiform, angular.—Sarmentose shrubs. Leaves opposite, petiolate, oblong, somewhat 5-nerved, quite entire, discoloured, glabrous above, but clothed with stellite or lepidodded down beneath as on the branches and peduncles. Inflorescence axillary, cymose, or subcorymbose, few or many-flowered. Flowers large, rose-coloured, bibracteate.

1 M. muscosa (Blum. in bot. zeit. 1831. no. 29. p. 504.) leaves somewhat cordate, ovate-oblong, acuminate, clothed with rusty scurfy tomentum beneath; peduncles many-flowered; calyx densely clothed with tomentum, intermixed with soft simple bristles. η. S. Native of Java, in mountain woods, where it is called by the natives Harendong-bulu. Melastoma muscosum, Blum. bijdr. p. 1070. Melast. ferruginea, Reinw. ined. Flowers large, rose-coloured.

Mossy Marumia. Shrub sarmentose.

2 M. stellulata (Blum. I. c. p. 505.) leaves oblong-ovate, rather coritate at the base or roundish, tomentose beneath; peduncles 1-5-flowered; calyx beset with spine-like bristles, which are stellately multifid at the apex. η. S. Native of Sumatra and Saloma. Melastoma stellulatum, Jack, in Lin. trans. 14. p. 6. Flowers large, rose-coloured.

Stellate-spined Marumia. Sh. sarmentose.

Ceylon Marumia. Shrub sarmentose.

4 M. zeylanica (Blum. I. c.) leaves ovate-oblong, rather coritate, bluntly acuminate, scurfy beneath; peduncles usually 3-flowered; calyx clothed with simple bristles. η. S. Native of Ceylon.

Ceylon Marumia. Shrub sarmentose.

Cult. For culture and propagation see Melastoma, p. 764. All the species bear showy flowers, and are therefore worth cultivating.

LXXIII. CREOCHITON (from Crepe, creper, flesh, and Christie, chiton, an outer coat; in reference to the outer coat, that is, the bractees, being fleshy and inclosing the flower-bud, in its young state). Blum. in bot. zeit. 1831. no. 29. p. 506.

Linn. syst. Octandra, Monogynia. Tube of calyx globose, adhering to the ovary; limb short; continuous, with the tube,
obsolescent and roundly 4-toothed, permanent. Petals 4, ovate-
roundish, oblique. Stamens 8, equal. Anthers obovate, thick,
arched, each furnished with a very short connective in front
at the base, and terminating in a short, uniporate beak at the
apex. Ovarium glabrous. Style thick, quadrangular; stigma small,
blunt. Berry dry, globose, crowned by the tube of the calyx,
4-celled. Seeds immeasurable, cuneo-oblung, with a linear
hyllum,—Climbing shrubs, with terete branchlets. Leaves op-
posite, petiolate, ovate or elliptic-oblung, quite entire, somewhat
5-nerved, quite glabrous above, but rather scurfy beneath.
Peduncles axillary and terminal, dilated at the apex, and unbel-
vably many-flowered. Each flower inclosed within two almost
bracteas before expansion. Flowers large, and rose-coloured.
1 C. pubiibunda (Blum. in bot. zeit. 1831. no. 29. p. 506.)
leaves ovate, bluntish, or obtuse at both ends, clothed with
scurfy dots; umbels simple, rarely branched, many-
flowered. \( \text{S. Native of Java, in woods near Kapang-
dungang, at the foot of Mount Salak, where it is called by the
natives \text{Tajjang-jung.} \) Melastoma pudibundum, Blum. bijdr.
p. 1071. Flowers large, red.

Blush Crecichon. Shrub cl.

2 C. bicracteata (Blum. l. c. p. 507.) leaves ovate, rather
cordate, bluntish, densely clothed with fulvous leprous tomo-
num on the nerves beneath, as well as on the branchlets and
peduncles; umbels simple, few-flowered. \( \text{S. Native
along with the preceding species, and where it is called by the
natives \text{Hareendlong-aroll.} \) Melastoma bicracteatum, Blum.
bijdr. p. 1071. Flowers large, red.

Bicracteate Creichon. Shrub cl.

Cult. See Melastoma for culture and propagation, p. 764.
Elegant climbing plants, bearing large showy flowers.

LXXIV. PHYLLAGATHIS (from \text{phyllos}, phyllon, a leaf, and \text{agathis}, a round heap; the flowers are disposed in
heads or heads, surrounded by leaves or bracteas). Blum. in
bot. zeit. 1831. no. 29. p. 507.

Linn. syst. Océtandra, Monogynia. Tube of calyx oblong,
robust, adhering to the ovary at the base; limb drawn out
beyond the calyx, 4-cleft. Petals 4. Stamens 8, equal.
Anthers arched, inapplicable at the base, beaked at the apex,
the beak opening by 1 pore? Style long. Berry 4-cleft.
—Shrub. Leaves opposite, large, roundish, 7-nerved, beset
with rusty dots beneath, standing on very long ciliated petioles.
Flowers purplish, densely crowded in axillary pedunculate heads,
each head involucrated, or surrounded by 5-6 broad cordon
nered bracteas.

1 P. rotundifolia (Blum. l. c.). \( \text{S. Native of Su-
matra.} \) Melastoma rotundifolium, Jack. in Lin. trans. 14.
p. 11.

Round-leaved Phyllogathis. Shrub 1 to 2 feet.

Cult. For culture and propagation see Melastoma, p. 764.

LXXV. LOREYÀ (dedicated to — Lorey, author of a

Linn. syst. Décandra, Monogynia. Tube of calyx campa-
ulate, adhering to the ovary at the very base, and truncate
at the apex. Petals 5, ovate, obtuse, rather cordate at the base.
Stamens 10; anthers thick, ovate, obtuse, rather gibbous at the
base. Ovarium glabrous at the apex. Style filiform; stigma
—A glabrous, Guiana shrub. Leaves petiolate, oval, triple-
nered, beset with the 2 marginal nerves, quite entire. Cymes
lateral, many-flowered.

1 L. arborescens (D. C. l. c.) glabrous; branchlets bluntly
quadangular, at length terete; leaves petiolate, oval-orbicolar,
obtuse, or mucronate, entire, 5-nerved, of the nerves rising
from the middle a little above the base; lateral racemes 7-8-
flowered, cymose; limb of calyx rather truncate; petals 5,
rather cordate at the base. \( \text{S. Native of French Guiana, in
woods, where it is called \text{Mele} by the inhabitants.} \) Melas-
toma arborescens, Aubl. guian. 1. p. 420. t. 163. Berry yellow,
eatable, very like a medlar.

Arborescent Loreyà. Tree 30 feet.

Cult. For culture and propagation see Melastoma, p. 764.

LXXVI. MICONIA (in honour of D. Micon, a Spanish
botanist). Ruiz et Pav. fl. per. syst. 1. p. 104. propl. 60.

Linn. syst. Décandra, Monogynia. Tube of calyx adher-
ing to the ovary; limb short, permanent, 5-toothed; teeth
obtuse, furnished with a broad membrane on the inside, usually
adpressed and connivent above the ovary after flowering.
Petals 5, obovate, obtuse. Stamens 10; anthers oblong-linear,
bluntly and shortly auriculated at the base. Ovarium rather
umbilicate at the apex, quite glabrous. Style filiform; stigma
obtuse. Capsule baccate, 5-celled. Seeds 3-sided, smooth,
with a black linear hyllum.—American, branched, smooth, or
rather hairy or tomentose shrubs, not as in \text{Climewinga} hispida.
Leaves variable. Flowers in terminal panicles. This genus is
perhaps divisible into many genera. Numbers of the species
are not well known.

SECT. I. LEIOPSPHÉRA (from \text{leipsos}, 
leios, smooth, and \text{phaira},
\text{phaira}, a sphere; in reference to the globular smooth fruit).
D. C. prod. 3. p. 179. Tube of calyx and fruit globose
and quite smooth. Flowers crowded, or in 1 series, disposed in
a thyrse on the ends of the branches.

1 M. racemosà (D. C. prod. 3. p. 179.) branches bluntly
tetragonal, but at length becoming terete, glabrous, but ciliated
at the knots; leaves petiolate, oval, attenuated at the base,
acuminate at the apex, serrated, and ciliated with bristles, 3-
nered, besides the marginal nerves, nearly glabrous on both
surfaces; thyrse panicked, terminal; having the flowers dis-
posed along its branches in 1 row. \( \text{S. Native of Guiana,}
Porto Rico, and Trinidad, in marshy places of woods.} \) Melas-
toma racemosà, Aubl. guian. t. 156. Rich. in Bonpl. mel. t.

Racemosò-flowered Miconia. Shrub 3 to 6 feet.

2 M. bariógora (D. C. l. c.) branches bluntly tetragonal,
but at length becoming terete, glabrous, ciliated at the knots;
petioles elongated, shortly at the apex; leaves lanceolate, acuminate,
ciliated with bristles, 3-nerved, besides the marginal nerves,
glabrous on both surfaces in the adult state; thyrse panicked,
terminal, having the flowers disposed in 1 series along its
branches. \( \text{S. Native of French Guiana, Inflorescences
as in M. racemosà. \) Leaves nearly as in M. \text{ciliata, but
the petals are about 3-times longer. Flowers white.}

Bearded-petioloed Miconia. Shrub 3 to 6 feet.

3 M. purpurascens (D. C. l. c.) branches bluntly tetragonal,
pubescent; leaves petiolate, oblong-lanceolate, acute, serrately
ciliated, pilose; thyrse panicked, terminal; having the flowers
disposed in 1 series along its branches. \( \text{S. Native of}
Guiana, on the banks of rivulets.} \) Melastoma purpurascens,
Aubl. guian. t. 154. but not of Swartz. Melast. purpùreà, Wild.

4 M. setinodôs (D. C. l. c.) branches terete, glabrous, ciliated
with bristles at the knots; leaves petiolate, ovate-oblong,
acuminate, ciliately serrated, 3-nerved, besides the 2 marginal
nerves, glabrous except the axils of the nerves, which
are bearded; thyrse terminal, panicked; calyx rather campanulate,
bluntly 6-toothed. \( \text{S. Native of South America, in
shady places on Mount Quindiu.} \) Melastoma setinòdis, Bonpl.
MELASTOMACEÆ.

Ciliated-leaved Miconia. Shrub 3 to 6 feet.

6 M. pileata (D. C. prod. 3. p. 180). branches tetragonal, and are as well as the petals and leaves more or less hispid, and ciliated from long stiff bristles; thyrse somewhat spicate, terminal; flowers almost sessile, disposed in crowded whorls; whorls distant. *t.* S. Native of Brazil, in woods. Melastoma ciliatum and pileatum, Schraknt. & Mart. mss. A very variable species, sometimes nearly glabrous, and sometimes very hispid. Flowers always glabrous. Seeds ovoid. Nearly allied to M. congestiflora. Bracteas in both ciliated, with bristles at the apex.

Cep Miconia. Shrub 6 feet.

7 M. Wyderianæ (D. C. in herb. Wydler. no. 225. mem. mel. p. 77.) branches bluntly tetragonal, but at length becoming terete, glabrous, but when young as well as the panicles somewhat tubercularly sebaceous from rufous hairs; leaves almost sessile, oval, acuminate, obtuse at the base, and somewhat cordate, quite glabrous above, but dotted from tubercular rufous down beneath; thyrse petiolate, terminal; flowers almost sessile, in crowded whorls. *t.* S. Native of Porto Rico, in the woods. Fruit globose, black.

Wydler's Miconia. Shrub 1 to 2 feet.

8 M. congestiflora (D. C. l. c.) branchlets tetragonal, and are as well as the panicles and petals quite glabrous; leaves petiolate, oblong, 5-nerved, glabrous on both surfaces, ciliate with long, stiff hairs; thyrse spicate, terminal; flowers crowded, in distant, many-flowered, opposite branches. *t.* S. Native of Brazil, in the province of Minas Geraes. Melast. sessiliflorum, Mart. herb. but not of Vahl. Calyx hemispherical, with 5 broad, small, permanent lobes. Petals obovate, emarginate. Anthers oblong, opening by 1 pore. Style filiform. Ovarium many-celled. Seeds angular.

Crowed-flowered Miconia. Shrub 6 feet.

9 M. brachyoda (D. C. l. c.) branchlets bluntly quadrangular, glabrous, villous, and briskly at the knots; petioles short, villous at the apex; leaves ovate, acuminate, obtuse at the base, acute, serrately ciliated, 3-nerved, besides the lateral nerves, pilose on the nerves on both surfaces, and beset with scattered dots of stellate down above; thyrse terminal, spicate, rather continuous. *t.* S. Native of St. Domingo. Melastoma cruceum, from Hispamia, Spreng. 1837. p. 302. exclusive of the synonyms, and the country Peru. Leaves yellowish on the under surface.

Short-petioled Miconia. Shrub 6 feet.

10 M. Rufescens (D. C. l. c.) branchlets bluntly tetragonal, densely clothed with pili; leaves almost sessile, cordate at the base, ovate, crenulately, sebaceous, rather tumultose, 5-nerved; thyrse spicate, terminal, densely clothed with pili; flowers crowded in something like whorls; the whorls distant. *t.* S. Native of Guiana, in fields. Melastoma rufescens, Aubl. guian. t. 157. Perhaps belonging to a different section.

Rufescens Miconia. Shrub 6 to 9 feet.

Sect. II. Eriospermæa (from copar, erion, wool, and σφάηα, sphaira, a sphere; in reference to the flower-bud being globose, as well as the leaves being clothed with tomentum). D. C. prod. 3. p. 180. Hypoxanthus, Rich. herb. Flower-bud globose, tomentose. Tube of calyx nearly globose; limb very short. Berry globose. Leaves discoloured, glabrous above and tomentose beneath. Panicle terminal, hoary, with opposite branches, and having the flowers sessile and disposed in a second manner along the branches, rarely crowded at the tops of the branches, or along a nearly simple rachis.

11 M. fuva (D. C. l. c.) branches tetragonal, and are as well as the petals, panicles, and under side of leaves clothed with whitish, rufescent, adpressed, rather stellate, lepidopted down; leaves opposite, or 3-4 in a whorl, elongated, hardly petiolate, attenuated at the base, and in the long slender acumen at the apex, 3-nerved, glabrous above, with the margins bluntly and repandly crenated; panicule terminal, with its branches opposite or in whorls; rachis tetragonal. *t.* S. Native of Cayenne. Melastoma chrysophylla, Rich. in act. soc. hist. nat. p. 1792. p. 109, but not of Dees. Melastoma fulta, Rich. in Bonpl. mel. t. 11. Flower-buds small and globose. Leaves 7-8 inches long and an inch broad. Flowers white.

Far. B. tinctoria (Mart. herb. ex D. C. l. c.) branchlets somewhat 2-edged, and are as well as the panicles and under side of leaves clothed with whitish, rufescent, rather stellate, lepidopted, adpressed down; leaves opposite, or 5-6 in a whorl, short petiolate, obtuse, tapering to the base, and acuminate at the apex, rather repand, glabrous above in the adult state, 3-nerved, besides the 2 marginal nerves. *t.* S. Native of Brazil. Flowers and fruit unknown. Allied to var. α, but differs in the leaves being much less crenated, and in the branchlets being 2-edged, not tetragonal.

Fulvous Miconia. Shrub 2 to 6 feet.

12 M. lepidota (D. C. l. c.) branchlets rather compressed, but at length becoming terete, and are as well as the petals, panicles, and under side of leaves clothed with rather stellate, small, somewhat rufescent, lepidopted down; leaves petiolate, oval, acuminate, quite entire, 3-nerved, quite glabrous above; panicle many-flowered, terminal, rather loose. *t.* S. Native of Brazil, at Para and the Rio Negro, in woods. Melastoma lepidotum, Schrak. & Mart. mss. Leaves not truly lepidotous, but discoloured from almost imperceptible down. Fruit hardly the size of a large mustard-seed. Teeth of calyx obtuse, very short. Seeds angular. Flowers not seen.

Lepidota Miconia. Shrub 2 to 8 feet.

13 M. argrophylla (D. C. prod. 3. p. 183.) branches acutely tetragonal, and are as well as the panicles, petals, and leaves clothed with white stellate down beneath; leaves petiolate, oval, acuminate, quite entire, glabrous above, 3-nerved, besides the marginal nerves; panicle terminal, raceme-formed, fruit globose, somewhat 10-ribbed. *t.* S. Native of Brazil, at the river Amazon. Melastoma argrophylla, Schrak. & Mart. mss. Teeth of calyx 5, short, acute. Seeds 5-sided, smooth. Flowers unknown.

Silver-leaved Miconia. Shrub 1 to 2 feet.

14 M. fallax (D. C. l. c.) branches tetragonal, and are as well as the panicles and under side of leaves clothed with white stellate tomentum; leaves petiolate, oval, acuminate, coriaceous, quite entire, somewhat 5-nerved, obtuse and somewhat cordate at the base, glabrous and shining above; panicle terminal, elongated, the flowers sessile and crowded on its branches. *t.* S. Native of Brazil, in the province of Bahia, in woods at the river Pernagua. Habit almost of M. holosericea, but differs in the petioles being shorter, and in the leaves being destitute of dots on the upper surface.

Fallacious Miconia. Shrub 6 to 8 feet.

15 M. stemnostachya (D. C. l. c.) branches tetragonal, and are as well as the petioles and under side of leaves clothed with
white stellate down; leaves petiolate, oval, acuminated, obtuse at the base, glabrous above, quite entire, 7-nerved, and margined with a slender nerve; panicle terminal, rather spike-formd; having the flowers sessile along its branches. \( \text{f. S.} \) Native of the interior of Brazil. Melastoma stenostachyum, Schrank et Mart. mss. This species comes very near \textit{M. holo-sericea} in the flower-bud, but differs in the nerves of the leaves being 7, not 5, nor glandular on the upper surface.

\textit{Slenedr-spiked Miconia}. Shrub 2 to 3 feet.

16 \textit{M. ferruginea} (D. C. l. c.) shrubby; branchlets thick, angular, and are as well as the petioles, panicles, and under side of leaves, densely clothed with stellate rather rufescent down; leaves petiolate, oblong, bluntish at both ends, coriaceous, quite entire, 5-nerved, glabrous on the upper surface; panicle terminal, elongated; flowers crowded on the short branches of the panicle; bracteas linear. \( \text{f. S.} \) Native of Brazil, in the provinces of Minas Geraes and Pernambuco. Melastoma ferrugineum, Schrank et Mart. mss. Leaves when young clothed with stellate velvety down. Calyx rather truncate, with an oblong, 10-ribbed tube. Petals small, white. Fruit almost globose. Petioles rather angular.

\textit{Var. \( \beta \), latifolia} (D. C. l. c.) leaves oval-oblong, acuteish. \( \text{f. S.} \) Native of Brazil, in the province of Minas Geraes. Melastoma Plunkenetti, Schrank et Mart. mss. 

\textbf{Rusty Miconia}. Shrub 6 feet.

17 \textit{M. herpetica} (D. C. l. c.) branches terete, and are as well as the petioles, panicles, and under side of leaves, as well as on the upper side of young leaves, densely clothed with stellate, rather rufescent, soft down; leaves petiolate, ovate, acuminated, entire, 5-nerved, or almost quinquelobate; panicle terminal, spike-formed; having the flowers crowded on its short branches. \( \text{f. S.} \) Native of Brazil, in mountain fields in the provinces of St. Paul and Minas Geraes. Melastom. herpteticum, Schrank et Mart. mss. Nearly allied to \textit{M. detergibilis}, but certainly distinct. Style longer than the stamens, not shorter as in \textit{M. holosericea}.

\textbf{Herpetic Miconia}. Shrub 2 to 3 feet.

18 \textit{M. detergibilis} (D. C. l. c.) branches terete, and are as well as the panicles, and under side of leaves, and upper side of the young leaves, densely clothed with soft, short, velvety tomentum; leaves petiolate, ovate-oblong, somewhat acuminated, entire, obtuse at the base, 5-nerved, at length glabrous above and minutely dotted; panicle terminal: having the flowers sessile, and crowded along its branchlets, and axillary. \( \text{f. S.} \) Native of Brazil, in the province of St. Paul, in elevated fields and woods. Melastoma detergibilis, Schrank et Mart. mss. Berry violaceous. Perhaps only a variety of \textit{M. holosericea}, but the flowers are crowded on the shorter as well as on the younger branches, not regularly disposed, as in that plant.

\textbf{Cleansing Miconia}. Shrub 4 to 6 feet.

19 \textit{M. holosericea} (D. C. l. c.) branches terete, and are as well as the petioles, panicles, calyxes, and side of leaves, as well as on the upper side when young, densely clothed with soft, velvety tomentum; leaves petiolate, oval-oblong, acute, obtuse and rather cordate at the base, 5-nerved, glabrous above but covered with very minute white dots; panicle terminal: having the flowers sessile and disposed in a second manner along its branches. \( \text{f. S.} \) Native of the West Indies, Guiana, and Brazil. Melastoma holosericea, Lin. spec. 566. but not of Swartz. Bonpl. mel. p. 52. tt. 23, 24. Melast. albicans, Swartz, fl. Ind. occ. 2. p. 786. ex Smith. Flower-buds and fruit globose. Petals white. Anters oblong, having their connectives thickish and biauriculate at the base. Branches and leaves usually naked through the summer. Berry 3-4-celled, violaceous. Seeds cuneate, 8-sided.

\textit{Var. \( a \), obtusiuscula} (D. C. l. c. p. 182.) leaves ovate-oblong.

\textit{Var. \( \beta \), acuminata} (D. C. l. c.) leaves elliptic-oblong, short-acuminated.

\textit{Var. \( \gamma \), oblongata} (D. C. l. c.) leaves oblong, long-acuminated, somewhat crenated, 5-nerved, quite glabrous above, but white from tomentum beneath; panicles terminal, spreading; flowers very numerous, on short pedicels; calyx acutely 5-toothed. \( \text{f. S.} \) Native of the West Indies, on the Mosquito shore. Melastoma argentea, Swartz, fl. ind. occ. 779, but not of Desr.—Sloane, jan. 1. 196. f. 1. ex Swartz. Flowers white, deciduous. Berry subglobose.

\textbf{Silky Miconia}. Shrub 6 feet.

21 \textit{M. serialis} (D. C. l. c.) branches terete, and are, as well as the peduncles, outside of calyxes, under side of leaves, petioles and nerves on the upper side clothed with soft, white, velvety tomentum; leaves approximate, on short petioles, oblong, acuminated at both ends, triple-nerved, quite glabrous, and shining above; thyrsic terminal, large, with its branches bifid, and bearing 1 flower in the bifurcation, the rest of the flowers sessile, and disposed in 1 series along the branches. \( \text{f. S.} \) Native of Brazil. A showy species. Lobes of calyx very blunt, glabrous inside.

\textbf{Rom-flowed Miconia}. Shrub 6 to 8 feet.

22 \textit{M. pipericarpa} (D. C. l. c.) branchlets from compressed to terete, and are, as well as the petioles, panicles, and under side of leaves clothed with small, white, velvety, stellate down; leaves petiolate, oblong, acuminated, quite entire, triple-nerved, glabrous above; rachises simple, terminal; bracteas sessile, under the pedicels. \( \text{f. S.} \) Native of Brazil, in woods. Galáxia pipericarpa, Mart. herb. Fruit globose, hardly so large as a grain of pepper, a little ribbed. Limb of calyx wanting. Seeds 2-3, smooth, large, obtuse at one end and angular at the other, with a black hymen.

\textbf{Pepper-fruited Miconia}. Shrub 2 to 3 feet.

23 \textit{M. mellicina} (D. C. l. c.) branches nearly terete, and are as well as the rachis and petioles densely clothed with rufous, scaly, branched down; leaves petiolate, oblong, acuminated, attenuated at the base, 3-5-nerved, serrated on the upper part, densely clothed with stellate tomentum beneath, but at length glabrous above; panicle terminal: having the flowers crowded on the branches; lobes of calyx 5, short. \( \text{f. S.} \) Native of Brazil, in the provinces of Minas Geraes and St. Paul, in humid parts of woods. Melastoma mellicum, Schrank et Mart. mss. Petioles 3 lines long. Leaves 8 inches long, and an inch broad. Nearly allied to \textit{M. herpetica}.

\textbf{Honey Miconia}. Shrub 6 to 8 feet.

24 \textit{M. bracteolata} (D. C. l. c.) branches somewhat tetragonal, and are, as well as the petioles, panicles, and young leaves on both surfaces, but in the adult ones only on the under, clothed with rufous stellate down; leaves petiolate, oblong, acuminated, quite entire, 3-nerved, glabrous on the upper surface in the adult state; thyrsic spicate, crowded; bracteas linear, much exceeding the flower-bud. \( \text{f. S.} \) Native of South America, between Loxa and Caxamara. Calyx bluntly 5-toothed. Petals 5, white. Capsule glabrous, 5-celled. Melastoma bracteolata, Bonpl. mel. t. 62.

\textbf{Bracteolate Miconia}. Shrub 4 to 6 feet.

25 \textit{M. leucocarpa} (D. C. l. c.) branches bluntly tetragonal, and are, as well as the panicles and under side of leaves, clothed with very short granular stellate down; leaves almost sessile, broadly ovate, obtuse, coriaceous, quite entire, 5-nerved, glabrous above; panicle terminal, having the flowers sessile, and

White-fruited Miconia. Shrub 6 to 8 feet.

26. M. elata (D. C. L.) branches angularly furrowed, clothed with rusty tomentum; leaves petiolar, oblong, acute, serrately denticulated, 5-nerved, glabrous above, and of an obscure green, but clothed with rusty tomentum beneath; flowers deciduous, panicked, crowded, sessile, small, white; calyx rather campanulate, minutely toothed; stigma thickened, depressed; berry minute. h. S. Native of Jamaica, on the higher mountains, and others of the West India islands. Melastoma elata, Swartz, fl. ind. occ. 2. p. 781. Leaves from half a foot to a foot long.

Tall Miconia. Tree 30 to 40 ft.

27. M. ferraínea (D. C. L.) branches terete; branchlets retrigenous, clothed with rusty tomentum; leaves ovate, acute, obsolescently crested, and somewhat ciliate, 3-nerved, glabrous above, but clothed with rusty tomentum beneath, as well as the petioles; panicles terminal; flowers small, pedicellate. h. S. Native of St. Domingo. Melastoma ferraínea, Desr. in Lam. dict. 4. p. 42. Leaves 3 inches long, and 15 lines broad. Corolla rather rose-coloured. Perhaps a variety of the preceding species.

Terrorine Miconia. Shrub 8 to 10 ft.

28. M. rubiginosa (D. C. Prod. 3. p. 183.) branches terete, and, as well as the petioles and under side of leaves, densely clothed with rufous down; leaves on short petioles, ovate-lanceolate, somewhat cordate at the base, acuminate at the apex, 5-nerved, or nearly triple-nerved, smooth and shining above; thyrse terminal, panicked; calyx globose, with 5 short acutish teeth. h. S. Native of South America, on Mount Quindiu. Melastoma rubiginosa, Bonpl. mel. t. 47. Berry blue, 3-celled. Petals 5, white. Anthers linear, opening by a pore.

Rustic Miconia. Shrub 12 feet.

29. M. celata (D. C. L.) branches terete, woolly; leaves lanceolate, 3-nerved, and as if they were blistered on the upper surface and glabrous, clothed with rufous wool beneath; flowers crowded, almost sessile; calyx globose, with 5 short teeth, quite glabrous; stamens length of corolla; thyrse straight, longer than the stamens, crowned by a thickish stigma; berry globose, 4-celled. h. S. Native of South America, on Mount Quindi. Melastoma rubiginosa, Bonpl. mel. t. 47. Flowers white.

Engrazed-leaved Miconia. Shrub 10 feet.

30. M. biglomerata (D. C. L.) branches terete, and are, as well as the petioles, racils, and nerves of leaves, clothed with small rufous velvety stellate down; leaves lanceolate, acute, 3-nerved, besides the marginal nerves, quite entire, reticulated beneath, and covered with rufous velvety down; thyrse terminal; flowers almost sessile, crowded in whorls; two of the whorls distant. h. S. Native of South America, on Mount Duida, at the source of the Oronoco. Melastoma biglomerata, Bonpl. mel. t. 15. Calyx obovate, velutine, with 5 very blunt teeth. Petals 5, white, small. Berry crowned, 4-celled.

Biglomerata-flowered Miconia. Shrub 6 to 8 feet.

31. M. aplostachya (D. C. L.) branches terete; leaves lanceolate, quite entire, 3-nerved, glabrous above, clothed with very fine rufous tomentum beneath; spike terminal, very simple; flowers sessile, deciduous; petals obovate; genial equal in length to the corolla; anthers rather falcate; berry globose, 3-celled, crowned by the calyx. h. S. Native of South America, near the river Oronoco about Atures and Maypurcs. Leaves like those of Nervicola Olearius. Melastoma aplostachya, Bonpl. mel. t. 1. Flowers white.

Simple-spiked Miconia. Shrub 4 feet.

Sect. III. Eumicônia (from eu, well or good, and Micônia; this section contains what are supposed to be the genuine species of the genus). D. C. Prod. 3. p. 183. Tube of calyx obvolute or turbinate, not globose as in the last section. Flowers not disposed in rows along the branches of the panicle.

* Leaves sessile, 5-7-nerved.

32. M. impetolaris (D. Don, in gen. soc. mem. 4. p. 312.) branches nearly terete, and are, as well as the panicles and under side of leaves, clothed with rufous stellate down; leaves sessile, half stem-clasping, ovate, rather cordate at the base, acuminate at the apex, quite entire, 5-nerved, glabrous above; thyrse panicked, terminal; flowers sessile; calyx globose, with 5 very short teeth, h. S. Native of the West Indies, Guadeloupe, St. Domingo, Jamaica, &c. Melastoma impetolaris, Swartz, fl. ind. occ. p. 788. Rich. in Bonpl. mel. t. 29. Melast. macrophylla, Desr. in Lam. dict. 4. p. 44. Berry blue, globose, 5-4-celled. Petals 5, white, orbicular. Anthers biariculate at the base of the connectives.

33. M. impetiônoïsa (D. C. L.) branches terete, and are, as well as the rachis, densely clothed with bristles, intermixed with stellate down; leaves sessile, broadly ovate, acuminate, somewhat crenulated, 5-nerved, sebaceous from stellate down on both surfaces, netted, the veins elevated beneath, and impressed above; spikes terminal; flowers sessile, bracteate, crowded in distant opposite fascicles. h. S. Native of Brazil, at the Rio Negro. Melastoma impetiônoïsa, Mart. herb. Calyx very villous, with short lobes. Petals small, ovate. Anthers long, opening by one pore, each with a slender biariculate connective. Style filiform. Inflorescence that of Lecânta.

Scabby Miconia. Shrub 4 to 6 feet.

* Leaves cuneated at the base, almost sessile, triple-nerved.

34. M. tomentosa (D. Don, l. c.) branches terete, and are, as well as the panicles, calyxes, and under surface of leaves, densely clothed with rufous stellate down; leaves sessile, ovate, cuneated at the base, acuminate at the apex, quite entire, glabrous on the upper surface except the nerves, 3-nerved a great way above the base, besides the submarginal nerve; panicle terminal, nearly cylindrical; calyx ovate-urecdeolate, with 5 erect short permanent ovate lobes. h. S. Native of Guiana and Brazil, in woods. Melastoma tomentosa, Rich. in act. soc. hist. nat. par. p. 109. Bonpl. mel. t. 16. Melast. megalophyllum, Mart. herb. Flowers white.

Tomentose Miconia. Tree 14 to 15 ft.

35. M. brevânea (D. C. Prod. 3. p. 184.) branches bluntly somewhat tetragonul, and are, as well as the panicles and under surface of leaves, densely clothed with rather bristly short rufous down; leaves almost sessile, ovate, rather cuneated at the base, acutish at the apex, glabrous on the upper surface in the adult state, 3-nerved above the base, besides the submarginal nerve; panicle terminal, with its branches spreading; calyx somewhat urecdeolate: with its lobes short, obtuse, and cohering. h. S. Native of Brazil, in the province of St. Paul, in woods. Melastoma brteineum, Mart. herb. Flowers sessile, crowded along the branches. Anthers linear, opening by one pore, tapering to the base. Style filiform. The foliage is like that of M. tomentosa.

Brown Miconia. Shrub 6 to 10 ft.

36. M. alata (D. C. Prod. 3. p. 184.) branches tetragonul, having the angles winged, and are, as well as the panicles, under side of leaves, and nerves on the upper surface, clothed with short stellate rather scabrous down; leaves sessile, cuneated at
the base, oval, acute, puberulous above from short scattered simple down, triple-nerved; nerves rising from about the fifth part of the length; panicle terminal, much branched; branches opposite. \( \xi \). S. Native of Guiana; and of Brazil, as in Maranham, provinces of St. Paul and Rio Janeiro. Melastoma alata, Auct. guian. t. 1. p. 410. t. 158. Clidemia alata, G. Don, in Loud.arty. p. 174. Leaves large. Lobes of calyx short, blunt. Style long, filiform. Flower bitterly baccate.

*Var. \( \beta \). Amazónica (Schrank, ss.) leaves broadly ovate, abruptly cuneate at the base. \( \xi \). S. Native of Brazil, on the banks of the Amazon.

Winged-stemmed Miconia. Shrub 3 to 4 ft.

37 M. cinchonifolia (D. C. l. c.) branches terete, and are, as well as the petioles, nerves of leaves, peduncles, and calyces, densely clothed with rufous stellate tomentose down; leaves petiolate, oval, quite entire, triple-nerved, glabrous above except on the nerves, but velvety beneath; raceme terminal, simple, spicate; tube of calyx oblong, a little longer than the 5 oblong lobes. \( \xi \). S. Native of Brazil, in dense woods in wet places at the river Tapura. Melastoma cinchonifolium, Mart. herb. M. leucanthrum, Schrank, ss. Leaves 8-10 inches long, and 2-3 broad. Anthers oblong, with hardly evident connectives. Peduncles usually bearing 3 approximate sessile flowers each. Style filiform, longer than the stamens. Petals linear, white.

Seeds small, trigonal, with a linear hylum.

Cinchone-leaved Miconia. Shrub 6 to 10 feet.

38 M. spondylanthum (D. C. l. c.) branches terete, and are, as well as the petioles, covered with adpressed villi; leaves on short petioles, broad-lanceolate, cuneate at the base, acuminate, villous beneath, but only on the nerves on the upper surface, the rest being beset with scattered pilis, quite entire, quinque-nerved, with the nerves distant; thyrse racemose, terminal, nearly simple; peduncles short, very hairy, 3-flowered; tube of calyx globose, bluntly 10-ribbed. \( \xi \). S. Native of Brazil, on the edges of woods, at Ega and Coari; and of French Guiana. Melastoma spondylanthum, Mart. herb. Leaves 9-10 inches long. Flowers unknown. Fruit the size of a coriander seed. Seeds numerous, small, trigonal, with a linear hylum.

Club-flowered Miconia. Shrub 6 to 10 feet.

39 M. discolor (D. C. l. c.) branches compressed, at length terete, when young, as well as on the under side of leaves, beset with silvery scale-like dots; leaves oval-oblong, cuneated, sessile, quinque-nerved, quite entire, glabrous above; thyrse terminal, lepidotetted when in a young state, but glabrous in the adult state, as well as the calyxes; fruit ovate, a little striated. \( \xi \). S. Native of Brazil, near Rio Janeiro. This species appears to be intermediate between the second and third sections of the genus, agreeing in the silvery down with M. argyrophylla, and in the form of the leaves with M. tomentosa.

Two-coloured-leaved Miconia. Shrub 4 to 6 ft.

40 M. punctata (D. Don, in soc. fern. mem. 4. p. 311.) branches tetragonal, and are, as well as the peduncles, petioles, and under side of leaves, clothed with small rufous purplish down; leaves on short petioles, oblong-lanceolate, acuminate at both ends, quite entire, triple-nerved, glabrous above, but rusty and dotted beneath; thyrse terminal, paned; calyx globose, usually 5-toothed. \( \xi \). S. Native of the West Indies, in mountain woods. Melastoma punctata, Desr. in Lam. dict. 4. p. 50. Rich. in Bonpl. mel. t. 40. Berry 3-celled, few-seeded. Petals 5, white, rather orbicular.

Dotted Miconia. Shrub 4 to 8 ft.

** Leaves on short petioles, disposed in whorls.

41 M. longifolia (D. C. l. c.) branches 8-ribbed, but at length becoming terete, and when young, as well as the petioles and peduncles, covered with rather scabrous stellate down; leaves on short petioles, oblong, attenuated at both ends, almost triple-nerved, glabrous above, but covered with small dot-like down beneath; panicle terminal, branching, immediately above the ultimate whorl of leaves; its branches angular, also disposed in whorls; calyx rather scabrous from stellate down, with 5 very short teeth. \( \xi \). S. Native of Cayenne, on the banks of rivulets; and of Brazil, in woods at the river St. Francisco. Melastoma longifolia, Auct. guian. t. 1. p. 452. t. 170. Flowers white.

Long-leaved Miconia. Ch. 1817. Shrub 4 to 6 ft.

42 M. LAMBERTIANA (D. C. prod. 3. p. 152.) branches 8-ribbed, and are, as well as the petioles and peduncles, rather scabrous from scattered stellate down, but at length becoming terete and glabrous; leaves on short petioles, oblong, attenuated at both ends, quite entire, 3-ribbed, glabrous above, beset with dots of stellate down beneath; panicle terminal, pedunculate, much branched, with its axis tetragonal, and its branches angular and in whorls; calyx scabrous from stellate down, with 5 short hardly evident teeth. \( \xi \). S. Native of the Island of St. Vincent. Anthers linear, biuriculate at the base, and opening by one pore at the apex. Style filiform. Fruit unknown. This species differs from M. longifolia in there being an interval between the ultimate whorls of leaves, and the branches of the panicle, and in the flowers being smaller.

Lambert's Miconia. Shrub 4 to 6 ft.

** ** Leaves petiolate, opposite, 3-5-nerved.

43 M. calve'scens (D. C. l. c.) branches nearly terete, and are, as well as the petioles, panicles, and calyces, white from short crowded stellate down, which at length falls off; leaves petiolute, oval, abruptly and shortly acuminate, crenated, obtuse at the base, triple-nerved, besides the marginal nerves, having the nerves rising near the base; when young velvety, but glabrous in the adult state except the nerves; panicle terminal, dense, many-flowered, having the flowers crowded on its branchlets.

\( \xi \). S. Native of Brazil, in the province of Rio Negro. Melastoma calve'scens, Schrank et Mart. ss. Allied to M. auriculata.

Naked Miconia. Shrub 4 to 6 ft.

44 M. eriodonta (D. C. l. c.) branchlets bluntly tetragonal, and are, as well as the petioles and peduncles, clothed with short rather rufescent hoary tomentose down; leaves petiolute, ovate, obtuse at the base, short-acuminate at the apex, quite entire, 3-ribbed, besides the two marginal nerves, quite glabrous above, rather purplish on the nerves beneath; thyrse terminal, rather racemose, with its branchlets bearing 2 or 6 flowers at the apex; fruit globose, 5-furred, pubescent; teeth of calyx 5, short, woolly, coning above the ovary. \( \xi \). S. Native of Cayenne. Fruit the size of a small pea, probably dry. Seeds angular, with a linear hylum.

*Var. \( \beta \). oblongifolia (D. C. l. c.) leaves oblong. \( \xi \). S. Native of Cayenne.

Hairly-toothed-calve'scens. Shrub 4 to 6 ft.

45 M. auriculata (D. C. l. c.) branches terete, and are, as well as the panicles, clothed with rufous stellate down, intermixed with bristles; leaves on short petioles, cuneate at the base, curled, oval-oblong, acuminate, ciliately serrated, scabrous on both surfaces from down, which is for the most part simple, quinque-nerved, besides the submarginal nerves, having the upper nerves rising a little above the base; panicles terminal, having the flowers crowded on the tops of its branches.

\( \xi \). S. Native of Brazil, in the province of St. Paul. Melastoma auriculatum, Mart. herb. Calyx hairy, with 5 short blunt lobes. Petals obovate. Anthers linear, bluntly auricled at the base, opening by one pore at the apex. Style filiform, exserted, 5 I
MELASTOMACEAE.

rather dilated at the apex, almost funnell-shaped. Leaves 4 inches long, and 1½ or 2 broad.

Var. β, thecamorimbus (D. C. L. c.) leaves paler beneath; branches less hairy. S. Native of Brazil, in the province of Bahia. Melastoma thecamorimbus, Schrank et Mart. mss. Leaves a little smaller than those of the species, but similar in form, the branches and panicles less hispid, but more tormentose, without being intermixed by bristles.

Auriell-anthered Miconia. Shrub 4 to 6 ft.

46 M. Sepia (D. C. L. c.) branches from compressed to terete, and are, as well as the panicles, whitish from small down, but at length becoming glabrous; leaves hardly petiolate, oval, tapering much to both ends, quintuple-nerved, almost quite entire, glabrous on both surfaces, but with the base of the nerves rather velvety; panicle terminal, oppositely branched; bractlets small; calyx covered with scattered stellate down, with 5 very short teeth. S. Native of Brazil, in hedges. Melastoma sepia, Schrank et Mart. herb. Antlers biauriculate at the base, opening by a pore at the apex.

Hedge Miconia. Shrub 4 to 6 ft.

47 M. Coleiata (D. C. L. c.) quite glabrous; branches rather purplished, but at length becoming terete; leaves oval, attenuated at the base, acuminated at the apex, triple-nerved, besides the two marginal nerves, with re%pand margins; panicle terminal, oppositely branched; bractlets small; teeth of calyx 5, obtuse, hardly evident. S. Native about Porto Rico, in woods on the hills. Petals ovate, small, apparently yellow, spotted with red in the dried state. Antlers linear, opening by one pore, biauriculate at the base. Stigma hardly dilated. Melastoma acuminata, Balb. herb. Melast. parviflora, Vahl. herb.

Hill Miconia. Shrub 4 to 6 ft.

48 M. Martiusiana (D. C. prod. 3. p. 186) glabrous; branches from tetragonal to terete; leaves petiolate, ovate-lanceolate, acute, coriaceous, quite entire, 3-nerved, besides the marginal nerves, shining above; panicle terminal: with its branches opposite and bearing many flowers at their tops, and knotted at their origin; calyceal teeth 5, obtuse, very short. S. Native of Brazil. Melastoma Martiusiana, Schrank et Mart. Petals ovate, reflexed. Antlers linear, biauriculate at the base, and opening by one pore at the apex. Style filiform. Stigma hardly dilated. Fruit unknown.

Martina's Miconia. Shrub 4 to 6 ft.

49 M. Maximiliana (D. C. L. c.) branches from compressed to terete, and are, as well as the petioles and peduncles, covered with short stellate down, intermixed with a few bristles, but at length becoming glabrous; leaves on short petioles, ovate-acuminated, serrately ciliated, quintuple-nerved, rather bristly on both surfaces, and pale beneath; panicle terminal. S. Native of Brazil. Melastoma Maximiliana, Mart. herb. Calyx beset with scattered stellate down, with 5 broad very short teeth. Petals ovate, yellow when dry. Stigma dilated, rather pilose. Antlers linear, biauriculate at the base, and opening by one pore at the apex.

Prince Maximilian's Miconia. Shrub 4 to 6 ft.

50 M. Loxensis (D. C. L. c.) branches nearly terete, and are, as well as the petioles, peduncles, and nerves of leaves on the under surface, clothed with thick fleshy curled down; leaves petiolate, oval, hardly obtuse at the base, short-acuminate at the apex, serrately denticulated, 3-nerved, smoothish beneath except on the nerves; thyrse panicle, terminal, crowded; calyx almost globose, bluntly and shortly 5-toothed. S. Native of Peru, in temperate places about Loxa. Melastoma Loxensis, Bonpl. mss. t. 43. Berry blue, 3-celled. Style nearly clavate. Petals 5, roundish, white.

Loza Miconia. Shrub 5 ft.

51 M. Urophylla (D. C. L. c.) branches terete, and are, as well as the petioles, clothed with powdery tomentum; leaves petiolate, oblong, quite entire, triple-nerved, clothed with velvety tomentum beneath, but glabrous above, each terminating in a long narrow taper-point; panicle terminal, many-flowered; tube of calyx globose, 10-ribbed; the limb deciduous; fruit dry, 3-celled, few-seeded. S. Native of Brazil, in the provinces of Minas Geraes and St. Paul. Rhésia caudata, Schrank et Mart. mss. Flowers unknown. Pericarp very thin, and perhaps adnate to the calyx. Seeds about 15, shining, triangular, with a long linear black hypanl.

Tail-leaved Miconia. Shrub 1 to 2 ft.

52 M. Fucidentes (D. C. L. c.) branches terete, and are, as well as the petioles, nerves of leaves on the under side, peduncles, and calyces, rather velvety, or dotted from scattered small stellate down; leaves oblong, attenuated at the base, acuminated at the apex, with a very few teeth on the margin, smoothish, 3-nerved; thyrse panicled, terminal; fruit globose, bluntly 10-ribbed. S. Native of Para, in Brazil. Melastoma fucidentes, Schrank et Mart. herb. The serratures are few, and acute at the apex of the leaves.

Few-toothed-leaved Miconia. Shrub 4 to 6 ft.

53 M. Mariquita (D. C. L. c.) branches rather compressed, and are, as well as the petioles, panicles, and under side of leaves, velvety from very minute stellate down; leaves petiolate, ovate, 3-nerved, quite entire, glabrous above, each terminating in a long narrow taper-point; panicles terminal, short, having the flowers crowded on its branches. S. Native of Brazil, in shady places in the province of Bahia, near Sincora. Melastoma caudatum, Schrank et Mart. mss. Petals oval-oblong, white. Nearly allied to M. caudatum, but differs in the leaves being nearly twice the breadth, and in being smooth above.

Tail-bearing-leaved Miconia. Shrub 1 to 6 ft.

54 M. Guayaquilensis (D. Don, in Mem. soc. warn. 4, p. 315.) branches from tetragonal to terete, and are, as well as the petioles and calyces, clothed with purplish rather powdery down; leaves on short petioles, oval, bluntly somewhat coriaceous at the base, acute at the apex, 6-nerved, 5 little toothed, glabrous; thyrse terminal, panicled; flowers tern, rather aggre-gate, nearly sessile; calyx bluntly 5-toothed. S. Native about Guayaquil. Melastoma Guayaquilensis, Bonpl. mss. t. 49. Petals 5, oval, white. Antlers bluntly biauriculate at the base. Leaves half a foot long. Berry 3-celled, crowned by the limb of the calyx.

Guayaquil Miconia. Shrub 8 to 10 ft.

55 M. Attenuata (D. C. L. c.) branches bluntly tetragonal, and are, as well as the peduncles and petioles, smoothish; leaves on short petioles, oval-oblong, attenuated at both ends, triple-nerved, besides the 2 fine marginal nerves, quite entire, glabrous on both surfaces; thyrse panicled, terminal, with its branches spreading; calyx rather velvety; limb with 5 very short teeth. S. Native of Cayenne. M. parviflora, Aubl. guian. t. 171. but the flowers are one-half smaller in the figure than in the specimen. Flowers white.

Var. β, subquintuplepinérella (D. C. L. c.) leaves almost quintuple-nerved; the nerves are more distinct, especially the 2 marginal ones. S. Native of Berbice. Berry small, globose, bluntly costate; calyx almost truncate, hardly 5-toothed.

Attenuated-leaved Miconia. Shrub 4 to 6 ft.

56 M. Caudata (D. C. prod. 3. p. 187.) branches tetragonal, and are, as well as the peduncles, hardly velvety, even when examined through a lens; leaves petiolate, ovate, long-acuminated, quite entire, 5-nerved; the outer nerves almost marginal, glabrous above, but clothed with adpressed rusty velvety down beneath; panicle terminal, divaricate and oppositely branched; bracteoles small, deciduous. S. Native of New Granada, between Mariquita and St. Anna. Melastoma caudata, Bonpl. 

LXXVI. Miconia.
MELASTOMACEÆ. LXXXVI. MICONIA.

795

mel. t. 7. Calyx bluntly 5-toothed. Anthers long, falcate. Style hairy at the base; stigma hardly tubid. Flowers rose-coloured. Different from Chitonía caudata, D. Don.

Tailed-leaved Miconia. Shrub 6 to 12 ft.

57 M. STAMMNEA (D. C. I. c.) branches compressedly tetragonal, and are, as well as the panicles and young leaves, velvety from short stellate down, but as length becoming glabrous from the down falling off; leaves petiolate, obtuse at the base, oval, acute, quite entire, 5-nerved, besides the submarginal nerves; branches of the panicle, which is terminal, opposite, 7-9-flowered; bracteae oblong-linear, shorter than the calyx; petals oblong, glabrous; stigma dot-formed. 迤. S. Native of Brazil, in the province of Rio Janeiro, in woods on the mountains. Melastoma staminata, Desr. in Lam. dict. 4. p. 53. Melastoma glabrés, Schrak et Mart. mss. Calyx tubular, velvety, with a 5-toothed limb; teeth ovate, acute. Anthers biarcuate at the base.

Var. β, oblongata (D. C. l. c.) leaves oval-oblong. 迤. S. Native of Brazil, in the province of Bahia.

Long-stamened Miconia. Shrub 4 to 6 ft.

58 M. APPINIS (D. C. l. c.) branches bluntly tetragonal, and are, as well as the petioles and panicles, rather conessent from almost imperceptible stellate down; leaves oval, obtuse at the base, short-acuminated at the apex, 5-nerved, quite entire, or hardly repand, glabrous above, but beset with scurf on the nerves beneath, with and dot-like down between the nerves; thyrse panicked, terminal, with spreading branches; limb of calyx very short, 5-toothed. 迤. S. Native of Cayenne. This species is difficult to distinguish from M. staminata, but differs from it, besides the characters given, in the flowers being one-half smaller, in the limb of the calyx being drawn out less, in the petals being oblong and obtuse, and in the fruit being without ribs, and tapering a little to the apex.

Allied Miconia. Shrub 4 to 6 feet.

59 M. SUCILLATA (D. C. I. c.) branches bluntly tetragonal, and are, as well as the panicles and leaves, glabrous, or when young covered with rather fleshy deciduous down; leaves on long petioles, oval, acuminate, obtuse at the base, 5-nerved, with the margins furnished with a few distant crenules and ciliæ; panicle oblong, terminal, bracteae oblong, small, shorter than the calyx; calyx somewhat obconical, shortly 5-toothed; petals oblong, rather velvety; stigma dot-formed. 迤. S. Native of Brazil, in woods along the banks of the Rio Negro. Melastoma levigiatum et M. procerum, Mart. et Schrak. mss. but not of Willd. Anthers linear. There is a circle of hairs round the peduncles at the base.

Subciliated Miconia. Tr. 12 to 20 ft.

60 M. CORONA (D. C. I. c.) branches acutely tetragonal, and are, as well as the panicles, petioles, and under side of leaves, clothed with powdery down; leaves petiolate, broad-oval, quin-tuple or septuple-nerved, quite entire, terminating each in a short acumen; panicle terminal, pyramidal; bracteae small, deciduous; tube of calyx globose, crowned by a 5-toothed limb. 迤. S. Native of South America, on Mount Quindiu. Melastoma coronata, Bonpl. mel. t. 56. Pets 5, white, oblong. Stigma rather peltate. Berry size of a small pea.

Crowned Miconia. Tree 10 to 20 ft.

61 M. PENDULIFOLIA (D. C. I. c.) branches terete, and are, as well as the petioles, panicles, and under side of leaves, rather velvety from powdery down; leaves petiolate, ovate-lanceolate, acute, 3-nerved, somewhat dentilicate, puberulent, glabrous above, panicle terminal, somewhat racemose; bracteae small, subulate; calyx with 5 very short teeth. 迤. S. Native of Guadaloupe, in woods. Melastoma pendulifolia, Bonpl. mel. t. 35. Pets 5, white, obovate. Anthers linear. Stigma hardly thicker than the style. Ovary 3-celled.

Pendulous-leaved Miconia. Shrub 4 to 8 ft.

62 M. HAVANA'NSSIS (D. C. prod. 3. p. 188) glabrous; branchlets terete; leaves petiolate, oblong, acuminate, 3-nerved, quite entire, pendulous; panicle terminal, racemose; bracteoles wanting or very small, and deciduous; limb of calyx shortly and bluntly 5-toothed; petals 5, oblong. 迤. S. Native of Cuba, about the Havannah. Very like M. pendulifolia, but differs in the margins of the leaves being quite entire, in the petals being oblong, and in the smoothness of the whole plant. Flowers white. Anthers linear. Stigma hardly dilated.

Havannah Miconia. Shrub 4 to 6 ft.

63 M. PYRAMIDALIS (D. C. l. c.) branchlets compressed, and are, as well as the petioles, panicles, and under side of leaves, but especially on the nerves, clothed with fleshy scurfy down; leaves oblong-lanceolate, acuminate, 3-nerved, besides the 2 marginal nerves, somewhat dentilicate; thyrse panicked, terminal; fruit bluntly ribbed, crowned by the calyx, which is somewhat repand and bluntly 5-toothed. 迤. S. Native of the West India Islands, Guadaloupe, Trinidad, Cuba, &e. Melastoma pyramidalis, Desr. in Lam. dict. 4. p. 53. Flowers white. Perhaps the same as Melastoma acinocédron. Lin. spec. 558.  configparser.

—Pluck. aln. t. 159. f. 1.

Var. β, ciliolata (D. C. l. c.) leaves ciliolate at the base, toothed at the apex. 迤. S. Native of Porto Rico, Guadalo- upé, and Trinidad. Melastoma Portoricénsis, Spreng. neue. endt. 3. p. 61.

Pyramidal Miconia. Cit. 1817. Shrub 4 to 8 ft.

61 M. NICOTIANA-FOLIA (D. C. l. c.) branchlets from compressed to terete, and are, as well as the petioles, panicles, and calyces, clothed with powdery pruinose small down; leaves petiolate, oval, acuminate, dentilicate, 5-nerved, glabrous in the adult state; thyrse panicked, terminal; limb of calyx bluntly 5-toothed, broader than the tube. 迤. S. Native of St. Domingo. Melastoma nicotianafolía, Desr. in Lam. dict. 4. p. 53. ex herb. mus. par. Bracteoles 2, small, acute, under each flower. Petals 5, oval, obtuse. Anthers linear, curved, obtuse, opening by a pore at the apex, and bluntly biarcuate at the base. Style filiform. Leaves 6 inches long, with the nerves yellow below. Perhaps the Melastoma acinoédron of Lin.

Tedoeaco-leaved Miconia. Shrub.

65 M. FLORIBU'NDA (D. C. l. c.) branches bluntly tetragonal, and are, as well as the petioles, nerves of leaves on the under surface, and calyces, rather velvety from rusty powdery down; leaves petiolate, oval, acutish at both ends, quite entire, septuple-nerved, glabrous above; panicle terminal, much branched, loose; bracteoles wanting or deciduous; calyx with 5 short teeth. 迤. S. Native of Peru, on the mountains in temperate parts. Melastoma floribunda, Bonpl. mel. t. 53. Petals rose-coloured, oval, truncate at the base. Filaments beset with glandular hairs at the apex. Anthers thick. Stigma broadly peltate. Berry 5-celled. From the anthers and the form of the stigma, this plant does not well accord with the other species of this genus.

Bundle-flowered Miconia. Tree 20 to 30 ft.

66 M. LEVIGÁ'TA (D. C. l. c.) branchlets terete, and are, as well as the petioles and peduncles, rather velvety from short stellate down, but at length becoming glabrous; leaves petiolate, oval, obtuse at the base, acuminated at the apex, ciliate serrated, 5-nerved, glabrous on both surfaces; cyme pani- cled, trichotomous at the base, terminal; branches of cyme 5 to 2.
MELASTOMACEAE. LXXVI. MICONIA.

bifid; flowers sessile, scent along the branches, and with a solitary one in each fork; calyx nearly globose, bluntly 10-ribbed, with 5 short obtuse teeth in lobes. ξ S. Native of the West Indies. Melastoma laviągāta, Desr. in Lam. dict. 4. p. 52. Flower-bud small, nearly globose, velvety. Capsule globose, 5-celled, umbonate from the calyx, and adhering to it. Seeds ovate, shining, with a basilar black hilum. Ker. bot. reg. t. 363. Flowers whitish.

Smooth Miconia. Cht. 1815. Shrub 6 to 8 ft.

67 M. trichòtoma (Desr. in Lam. dict. 4. p. 58.) branches nearly terete, and are, as well as the petals and panicles while young, rather velvety from short down, but at length becoming glabrous; leaves petiolate, broadly oval, short-acuminate, 3-5-nerved, glabrous on both surfaces; thysre panicled, terminal, with spreading ifliform branches; teeth of calyx 5, erect, short, permanent. ξ S. Native of Martinique. Melastoma trichòtoma, Desr. in Lam. dict. 4. p. 53. Seeds ovate, angular, with a black hylum. A conger of M. lewigliata. Compare it with Melastoma nigricans, Vahl. cht. 3. p. 26. ex Scr.

Trichotomous-pamidic Miconia. Shrub 4 to 6 ft.

68 M. pra'sina (D. C. I. c.) glabrous; branches somewhat tetragonal; leaves petiolate, broad-lanceolate, quite entire, triple-nerved, glabrous on both surfaces; thysre panicled, terminal, with spreading ifliform branches; teeth of calyx 5, erect, short, permanent. ξ S. Native of Jamaica and Hlpaniola, in woods. Melastoma prasina, Swartz. fl. ind. occ. p. 777. exclusiva of the synonyme of Aubl. This plant differs from the figure given by Aublet, now M. microcarpa, in the leaves being triple-nerved, not 5-nerved, quite entire, not somewhat denticulated, in being glabrous on both surfaces, not velvety on the under surface, and in the teeth of the calyx being permanent, not deciduous, &c.

Loek-green Miconia. Cht. 1817. Shrub 4 to 6 ft.

69 M. microcarpa (D. C. prod. S. p. 189.) branches bluntly tetragonal, but at length becoming terete, and are, as well as the panicles, petioles, and nerves of leaves on the under surface, velvety from almost imperceptible stellate down; leaves petiolate, ovate-lanceolate, acuminate, somewhat attenuated at the base, 5-nerved, repandly denticulated, glabrous above, but beset with scattered dot-like down between the nerves on the under surface; thysre panicled, terminal, much branched, loose; fruit globose, bluntly 10-ribbed; limb of calyx deciduous, very short, toothed, truncate. ξ S. Native of Brazil, in woods in the provinces of Para and Rio Negro; and probably of Guiana, if M. laviągāta, Aubl. guian. 1. p. 412. t. 59. is referrible to this species, which is most likely the case. Flowers white.

Small-fruited Miconia. Shrub 4 to 6 ft.

70 M. ambigua (D. C. I. c.) branches terete, glabrous? leaves petiolate, oblong-oval, acuminate, acute at the base, 5-nerved, somewhat denticulatedly serrated, membranous, powdery on the nerves beneath; thysre terminal, panicled, loose-flowered, powdery; limb of calyx 5-toothed, permanent. ξ S. Native of South America, in Cumana, at Caripò. Melastoma ambiguа, Bonpl. mel. t. 25. Petals 5, white, roundish. Berry globose, 3-celled. The teeth of the calyx are convolute above the ovary after flowering.

Ambiguous Miconia. Shrub 6 ft.

71 M. ceanotho [a] (D. C. I. c.) branches from compressed to terete, and are, as well as the petioles, panicles, and nerves of leaves, and both surfaces of leaves while young, clothed with small fleshy velvety stellate down; leaves petiolate, ovate-lanceolate, acuminate, obtuse at the base, almost quite entire, glabrous above in the adult state, 3-nerved, besides the 2 marginal nerves; thysre panicled, terminal; berries globose, usually 10-ribbed, crowned by 5 obtuse convincing teeth. ξ S. Native of Guadaloupe, Trinidad, Cuba, &c. Nearly allied to M. ambigua. Flowers white.

Ceanothus-like Miconia. Shrub 4 to 6 ft.

72 M. minutiflōra (D. C. I. c.) quite glabrous; branches nearly terete; leaves petiolate, lanceolate, quite entire, 5-nerved, membranous; thysre terminal, panicled, loose; calyx short, campanulate, hardly 5-crenate. ξ S. Native of Cumana, near the monument called Guicharo. Melastoma minutiflōra, Bonpl. mel. t. 22. Calyx nearly entire. Flowers minute, white; petals roundish. Ovarium nearly free, 3-celled. According to Bonpland's figure the nerves are reflexent beneath, and probably from down.

Minute-flowered Miconia. Shrub 6 ft.

73 M. coriacea (D. C. I. c.) branches tetragonal, and are, as well as the petioles and nerves of leaves, beset with simple hairs, which are rather glandular at the apex, intermixad with rough minute fascicules of down; leaves petiolate, oval, callously serrated, coriaceous, terminating in a stiff point, wrinkled, smoothish, with revolute margins; thysre terminal, panicled, with crowded flowers, having its branches and racis tetragonal; calyx turbinate, with obtuse permanent lobes, which are furnished with one bristle each on the outside. ξ S. Native of Guadaloupe, on the top of the Sulphur Mountain. Melastoma coriacea, Swartz. fl. ind. occ. p. 790. Melast. cymhifolia, Rich. in Bonpl. mel. t. 26. Flowers yellowish. Stigma obtuse. Berry cincerely, 3-celled. Leaves concave beneath and convex above.

Coriaceous-leaved Miconia. Shrub 3 to 6 ft.

74 M. sieb bif. (D. C. I. c.) quite glabrous; branches tetragonal; leaves petiolate, oval, with stiff points, coriaceous, callously serrated, 5-nerved, flattish; thysre terminal, panicled, crowded with flowers, having its branches and racis tetragonal; bracteas oblong, membranous, under the branches of the panicle. ξ S. Native of the island of Trinidad. Sieb. fl. trin. no. 260. Habit of M. coriacea, but is distinguished from that plant in the smoothess.

Sieber's Miconia. Shrub 4 to 6 ft.

75 M. lutescens (D. C. I. c.) branches bluntly tetragonal, and are as well as the petioles, nerves of leaves on the under surface, and racis yellowish; leaves petiolate, oblong, acute at the base, and acuminate at the apex, glabrous above, but clothed with white, deciduous, woolly down beneath when young, 3-nerved, toothed; thysre terminal, panicled, many-flowered; calyx globose, with 5 very short, acute teeth. ξ S. Native of Peru, near Lima, on Mount Saragura. Melastoma lutescens, Bonpl. mel. t. 17. Petals roundish-ovate, white. Anthers opening by 1 pore. Stigma obtuse. Berry globose, 3-celled, crowned.

Yellowish Miconia. Shrub 4 to 6 ft.

76 M. thomasi'na (D. C. I. c.) glabrous; branches terete; leaves petiolate, oval, bluish, triple-nerved, with quite entire, rather revolute edges, cariaceous; cymes terminal, trifid at the base, with its branches somewhat racemose; tube of calyx turbinate, covered with scurfy stellate down, with 5 broad obtuse lobes; fruit globose, hispid from a few bristles. ξ S. Native of the Island of St. Thomas. Melastoma coriacea, Juss. in herb. mus. par. Stannis 10; anthers without auricles. Petals 5, oval. Seeds trigonal, candated, shining, with a linear concave hylum. Flowers yellowish.

St. Thomas Miconia. Shrub 2 to 3 feet.

77 M. astrolasía (D. C. prod. 3. p. 190.) branches terete, and are as well as the panicles, under side of leaves, and petioles densely clothed with rufous stellate down; leaves on short petioles, ovate, obtuse at the base, and acute at the apex, quite entire, 3-nerved, beset with dots of stellate down above, but at length becoming smoothish; panicle terminal, much branched. ξ S. Native of St. Domingo. Melastoma astrolasía, Spreng.
LXXVI. Miconia. LXXVII. Oxymeris. LXXVIII. Cremanium.

Starry Miconia. Shrubs 4 to 6 feet.

78 M. lanceolata (D. C. l. c.) branches somewhat tetragonal, and are as well as the petioles, under side of leaves, and panicles velvety from short, rufous, stellate down; leaves petioleolate, oblong-lanceolate, denticulated, 3-nerved; panicles terminal; flowers sessile, on the tops of the branches of the panicle. &. Native of St. Domingo. Melastoma lanceolata, Desr. in Lam. dict. 4. p. 43. Flowers small.

Lanceolate-leaved Miconia. Shrubs 4 to 6 feet.

79 M. Macroste'nya (D. C. l. c.) branches nearly terete, and are as well as the petioles, tetragonal rachis, and under side of leaves velvety from rufescent, short, soft down; leaves petioleolate, oblong-linear, attenuated at the base, blunting, but mucronate at the apex, 3-nerved, quite entire, quite glabrous above; thyrse spicate, terminal, very long; flowers crowded, in whorls; tube of calyx obovate, scurfy, with 5 short obtuse lobes. &. Native of Brazil.

Long-spiked Miconia. Shrubs 4 to 6 feet.

80 M. Pulverule'ntsa (Ruiz et Pav. syst. 1. p. 104.) branches bluntly tetragonal, and are as well as the petioles, panicles, calyces, and under side of leaves white from soft, scurfy, stellate down; leaves oval, obtuse at the base, 5-nerved, somewhat acuminate at the apex, and rather serrulate, glabrous above in the adult state; thyrse terminal, panicked; flowers with 5-8 petals; tube of calyx turbinate. &. Native of Peru, in woods. Pomerella tomentosum, Domb. herb. Ovarium glabrous at the base. Calyx drawn out beyond the ovary.

Petals 5, obtuse, obturate. Stamens short.

Powdery Miconia. Shrubs 4 to 6 feet.

81 M. Triples'ne'vis (Ruiz et Pav. l. c. p. 105.) leaves oblong, triple-nerved, acuminate, quite entire. &. Native of Peru, on mountains towards Cuchero, and in the tract of Guayabal.

Triple-nerved-leaved Miconia. Tree 20 feet.

82 M. Langini'o'sa (Ruiz et Pav. l. c.) leaves oblong, 5-nerved, quite entire, bluntly acuminate. &. Native of Peru, at Cuchero, in groves near Casape and Cassapillo.

Woolly Miconia. Tree 18 feet.

83 M. Emargina'ta (Ruiz et Pav. l. c. p. 106.) leaves cordate, emarginate, 5-nerved. &. Native of Peru, in groves at Chinchao. Ruiz et Pav. fl. per. incd. 4. t. 394.

Emarginate-leaved Miconia. Shrub 10 to 18 feet.

Cult. For culture and propagation see Melastoma. Many of the species are worth cultivating for the sake of their fine foliage, but none of them for their flowers, which are always insignificant.

LXXVII. OXYMERIS (from ὀξυς, oxyz, sharp, and μερις, meris, a part; in reference to the pointed petals and calyceous teeth). D. C. prod. 3. p. 190.

Linn. syst. Decandria, Monogyenia. Calyx quite glabrous, with an obovate, turbinated tube and 5 very short, calyceous teeth. Flower-bud conical. Petals lanceolate, acuminate. Stamens 10, equal; anthers oval-oblong, obtuse, opening by 1 pore at the apex, but tapering to the base, each furnished with a short filiform connective, which is rather biggish at the base. Style filiform, crowned by a dot-formed stigma. Ovarium quite glabrous. Capsule baccate, 3-4-celled. Seeds unknown. Quite glabrous, Brazilian shrubs. Leaves petioleolate, oblong, quite entire, 3-nerved. Panicle terminal. Becteas subulate. Flowers white or yellowish.

1 O. quant'a-Develta (D. C. prod. 3. p. 190.) quite glabrous, branched, between terete and compressed, subulate subteretional at the tops; leaves petioleolate, oblong-obtuse, attenuated at both ends, 3-nerved, quite entire; panicle terminal, beset with small, rather resinous dots; bracteas small, linear; calyx obovate, with 5 short teeth; petals lanceolate, ending in a callous acumen. &. Native of Brazil, in the province of Minas Geraes. Melastoma oxyepetalum, Schrank et Mart. ms. Habit of a species of Gentiana, and of a yellow hue when dried.

Five-toothed-leaved Oxymeris. Shrub.

2 O. Quant'quí' nodis (D. C. l. c.) quite glabrous; branches bluntly tetragonal or compressed; leaves petioleolate, long-lanceolate, acuminate at both ends, quite entire, 3-nerved; panicle terminal; bracteas linear-subulate; tube of calyx globose, with 5 grain-formed callous lobes. &. Native of Brazil, in woods in the province of Minas Geraes, at Mount Serra da Carazza. Melastoma quinquenode, Schrank et Mart. ms. Flowers small, white, numerous. Nodes or grain-formed lobes of calyx yellowish.

Five-knotted-calypso Oxymeris. Shrub.

Cult. For culture and propagation see Melastoma, p. 764.

LXXVIII. CREMANIUM (κριμαω, kremao, to suspend; because most of the plants contained in this genus climb on trees). D. Don, in mem. soc. wern. 4. p. 310. D. C. prod. 3. p. 191. Linn. syst. Decandria, Monogyenia. Tube of calyx campanulate or obovate, opening by 5 pores, the ovary or the ovary and limb permanent, 3-5-toothed. Petals 5-5, obovate. Stamens 10, equal. Anthers short, rather cuneate at the base, without auricles; opening by 2 pores at the apex. Style filiform; stigma orbicularly petalate. Capsule baccate, 3-5-celled. Seeds angular or ovate, with a linear hilum.—American, branched shrubs. Leaves petioleolate, rather coriaceous, quite entire, or somewhat serrated. Panicle terminal. Bracteas small, at the base of the branchlets. Flowers for the most part white, small, and bracteless.—Some of the species of this genus will perhaps, on future investigation, prove to belong to Miconia.

* Flowers octandrous.

1 C. Roton'difolium (D. Don, mem. soc. wern. 4. p. 311.) stem creeping; branches tomentose; leaves cordate, orbicular, quite entire, green, hispid on both surfaces; flowers usually 4 together, on short pedicels. &. Native of Peru. Flowers large, white.

Round-leaved Cremanium. Shrub creeping.

2 C. N'tidum (D. Don, l. c.) stem rooting; branches glabrous, spreading; leaves ovate, acute, glabrous, shining, with rather winged, toothed margins; racemes glabrous, nodding; filaments beset with glandular hairs. &. Native of Peru. Flowers white.

Slender Cremanium. Shrub creeping.

3 C. Thyrsoid'eum (D. Don, l. c.) stem rooting; branches tomentose; leaves lanceolate, acute, 3-nerved, quite entire, glabrous, shining, pilose on the nerves beneath; flowers drooping, crowded into a compound thyrse. &. Native of Peru. Flowers white, not half the size of those of C. ntidum.

Thyroid-flowered Cremanium. Shrub creeping.

4 C. Lat'tifolium (D. Don, l. c.) branchlets pilose; leaves ovate, cordate, acute, serrulate, naked, and shining above, but pilose beneath; panicle terminal, many-flowered. &. Native of Peru. Flowers small, white.

Broad-leaved Cremanium. Shrub.

5 C. Vaccinoidea (D. Don, l. c. p. 312.) glabrous; branchlets tetragonal, slender; leaves oval, obtuse, quite entire, hardly 3-nerved, the lateral nerves being so slender as hardly to be discernible; racemes 5-flowered, terminal, drooping a little, simple or pedicelled, solitary, 1-flowered, lower ones axillary; limb of calyx repand, 4-toothed, obtuse. &. Native of Peru, on the Andes above Caxamarca. Melastoma vaccinoidea, Bonpl. mel. t. 8. Leaves pale beneath. Petals white, spotted with

* Whortle-berry-like Cremanium. Shrub 3 to 6 feet.

6 C. rubens (D. C. prod. 3. p. 191.) quite glabrous; branchlets tetragonal, furrowed; leaves petiolar, ovate-lanceolate, acuminate, denticulated, 3-nerved; panicle terminal, somewhat racemose; branchlets tetragonal, opposite; flowers dioecious, octandrous, and decussated, crowded. H. S. Native of the south of Jamaica, on the hills. Melastoma rubens, Swartz, fl. ind. nec. p. 737. Branches blood-red. Berry small, blue. The parts of flowers are quaternary or quinary, but most frequently quaternary. Petals roundish, small, white.

* Reddish-stemmed Cremanium. Shrub 3 to 6 feet.

7 C. elegen'denum (D. C. l. c.) quite glabrous; branchlets from compressed to terete; leaves petiolar, oblong, elongated, tapering to both ends, triple-nerved, and as if they were appiculated beneath at the origin of the lateral nerves; panicle terminal, much branched; lobes of calyx 4, obuse, short, H. S. Native of Brazil. Flowers small; petals oval. Anthers narrowed at the base, and opening by 2 wide pores at the apex. Stigma peltate.

* Olive-tree Cremanium. Shrub 2 to 3 feet.

8 C. glandulosum (D. C. l. c.) branches bluntly tetragonal, clothed with whitish tomentum while young; leaves ovate, 3-nerved, entire, strigose above, and beset with glandular rough hairs beneath; racemes terminal; flowers crowded, almost sessile, octandrous, minute. H. S. Native of Jamaica, on the mountains. Melastoma glandulosum, Swartz, fl. ind. nec. p. 799.

Glandular Cremanium. Shrub 3 to 6 ft.

** Flowers deciduous.

9 C. med'ium (D. Don, in mem. wern. soc. 4. p. 313.) stem erect; branchlets pilose; leaves elliptic, acute, serrated, naked, and shining above, but pilose beneath; thyrse compound; flowers drooping. H. S. Native of Peru. Flowers small, white.

10 C. calophyllum (D. Don, l. c.) stem erect; leaves cuneate-oblong, coriaceous, glabrous, quite entire, marginate, shining above, but feather-nerved, and finely reticulated beneath; panicle terminal, much branched. H. S. Native of Peru. Melastoma ovatum, Pav. in herb. Lam. Leaves like those of a myrtle. Flowers very small, white. Style twice the length of the stamens.

* Beautiful-leaved Cremanium. Shrub.

11 C. laur'imum (D. Don, l. c.) stem erect; branchlets pilose; leaves lanceolate, obtuse, quite entire, 3-nerved, glabrous above and pilose beneath; panicle racemose; flowers drooping. H. S. Native of Peru. Flowers small, white.

* Laurel-like Cremanium. Tree.

12 C. ceruleum (D. Don, l. c.) stem climbing; branchlets very pilose; leaves lanceolate, acuminate, quite entire, 3-nerved, rough above, but very pilose beneath; panicle bracteate, hispid. H. S. Native of Peru. Melastoma ceruleum, Pav. in herb. Lamb. Flowers small, white. Berry small, globose, blue.

* Blue-barked Cremanium. Shrub cl.

13 C. cele'stum (Don, l. c.) stem erect; branchlets powdery; leaves ovate-lanceolate, acuminate, crenulatet, 3-nerved, powdery on the under surface; panicle bracteate; flowers glomerate. H. S. Native of Peru. Melastoma celestum, Pav. in herb. Lamb. Flowers small, white. Style twice the length of the stamens.

* Sky-blue-barked Cremanium. Shrub.

14 C. serrulatum (Don, l. c.) stem erect; leaves elliptic-oblong, acute, serrulatet, 3-nerved, glabrous; panicle bractiate; flowers glomerate; style about half the length of the stamens. H. S. Native of Peru. Melastoma serrulatum, Pav. in herb. Lamb. Flowers small, milk-coloured.

* Serrulat-leafed Cremanium. Shrub.

15 C. hispidissimum (D. C. prod. 3. p. 192.) branchlets terete, and as well as the petioles, peduncles, and calyces hispid from long, stiff, spreading bristles; leaves petiolar, ovate, short-acuminate, 5-nerved, ciliately pilose on both surfaces; thyrse panicked, terminal; having its branches spreading. H. S. Native of Peru. A very showy species. Lobes of calyx feathered by bristles. Petals 5, oval, obuse, yellow in a dried state. Filaments and style beset with glandular bristles.

Anthers arched, obtuse, opening by 2 confluent pores, and ending in 2 short bristles at the base.

* Very-hispid Cremanium. Shrub 2 to 3 feet.

16 C. papillosum (D. C. l. c.) branchlets terete, and as well as the petioles, and raehis velvety from rather fleshy, short, stellate, crowded down; leaves ovate, blgntish, 7-nerve, ciliately crenulated, beset with bristles above, which are swollen at the base, but reticulated and covered with hairs beneath; panicle terminal, many-flowered; calyx velvety, hardly 5-toothed; stigma petalate; anthers 2-celled? H. S. Native of Peru. Melastoma papillosum, Desr. in Lam. diet. 4. p. 48.

* Papillose Cremanium. Shrub 4 to 5 ft.

17 C. reclin'atum (D. C. l. c.) quite glabrous and bushy; branchlets reclinate at the apex; leaves petiolar, ovate, 3-5-nerved, quite entire; thyrse terminal, few-flowered; calyx campanulate, hardly 5-toothed. H. S. Native of Peru, on Mount Saraguru, in temperate places. Melastoma reclinatum, Bonpl. mel. t. 48. Petals small, white, ovbuate. Anthers wedge-shaped, furnished with a simple, memhraneous appendage behind, and opening by 2 pores at the apex. Stigma capitate, depressed.

* Berry 3-celled.

* Rellinite-branched Cremanium. Shrub 3 to 5 feet.

18 C. quadrangularis (D. C. l. c.) branches smoothish, tetragonal; leaves petiolar, ovate-lanceolate, acuminated, entire, 3-nerved, stiff, glabrous above and rusty beneath; thyrse panicked, terminal, straight, with its branches opposite and angular; calyx ovate, incercous from stellate down, with its lobes ovate, obuse, and membranous; stigma capitata. H. S. Native of Jamaica, on the mountains. Melastoma quadrangularis, Swartz, fl. ind. nec. p. 770. The branches, and probably the peduncles, are clothed with minute velvety down when young. Leaves yellowish above; nerves thick, the lateral ones almost marginal.

Anthers opening by 2 pores, according to Swartz.

* Quadrangular-branched Cremanium. Shrub 3 to 6 feet.

19 C. f. grandulum (D. C. l. c.) branches bluntly tetragonal, and as well as the petioles, panicles, and under side of leaves densely clothed with rusty, powdery, velvety, fleshy down; leaves petiolar, oblong-oval, with somewhat revolute margins, hardly toothed, 3-5-nerved, glabrous above; panicle terminal: having its branches opposite, with the flowers crowded at their tops. H. S. Native of New Granadas, in shady woods near Ybague. Melastoma grandulum, Bonpl. mel. t. 12. Limb of calyx 5-toothed, drawn out beyond the ovariun; having the teeth spurred on the outside. Petals ovate, white. Anthers bearing 2 short auricles at the base, but bluntesth and opening by 2 pores at the apex. Stigma capitate.

Ovarium a little toothed at the apex. Allied to C. quadrangularis.

* Granular Cremanium. Shrub 10 to 15 feet.

20 C. ? asperillate (D. C. prod. 3. p. 192.) branchlets terete, and as well as the petioles, panicles, and under side of leaves clothed with rufous stellate tomentum; leaves on short petioles, oblong-oval, serrulated, 3-nerved, glabrous above; panicle short, thyrsoid; having its branches opposite, and bearing the flowers in tufts at their tops. H. S. Native of Quito.
between Doyt and Cuenca. Melástoma aspergillus, Bonpl.

Roughish Cremanium. Shrub 3 to 6 feet.

21. C. ledifolium (D. C. L. c.) branchlets terete, and are as well as the pedicels, peduncles, and under side of leaves densely clothed with stellate down; leaves hardly petiolate, oblong, with revolute edges, and hence nearly linear, obtuse, coriaceous, 1-nerved, glabrous on the upper surface, except on the nerves; thryse spike-formed, axillary, and terminal, few-flowered; calyx campylanulate, rather velvety, blunter 5-toothed. f. S. Native of Chimboraco. Petals small, obovate. Anthers 2-celled. Stigma hardly dilated.

Ledum-leaved Cremanium. Shrubs 2 to 3 feet.

22. C. glabrum (D. C. L. c.) quite glabrous; branches nearly terete; leaves oval or ovato, triple-nerved, quite entire, beset with glandular dots above, each terminating in a very short acumen; panicle terminal; bracteas small, linear; calyx globose, with 5 short, acute teeth. f. S. Native of Brazil, in woods between Lorena and St. Paul. Melastoma dimorphum, Schrak and Mart, mss. Habit of C. milleflorum. Dots on leaves, elongated, yellow, small, and scattered. Flowers small, white. Anthers oblong, obtuse, opening by 2 pores at the apex, each furnished with a slender connective. Style dilated and rather tube-formed at the apex.

Very smooth Cremanium. Shrub 6 to 8 feet.

23. C. minutiflorum (D. C. L. c.) glabrous, except in the young parts, which are furnished with scattered dots of white flocky down; branches obscurely tetragonal; leaves elliptic-oblong, acuminate, rather serrulate, 3-nerved, besides the marginal nerves; panicle terminal. f. S. Native of Brazil, in woods at Capoera. Melastoma minutiforum, Schrak and Mart, mss. but not of Bonpl. The leaves are yellowish when in a dry state. Anthers oval, obtuse, opening by 2 pores. Style short, dilated at the apex. Flowers small; petals oval. Habit of the following species.

Minute-flowered Cremanium. Shrub 4 to 6 feet.

Thousand-flowered Cremanium. Shrub 2 to 3 feet.

25. C. olgiothrix (D. C. L. c.) branches bluntly somewhat tetragonal; leaves oval, acute, 3-nerved, besides the marginal nerves, glabrous on both surfaces in the adult state, and very bluntly crenated, cleft from bristles, which rise from the notches; petioles bearing a few bristles at the apex; panicle terminal, many-flowered. f. S. Native of Mexico. The leaves, when young, are covered with scattered, stellate down on the under surface. Petals red, nearly emarginate. Calyx dotted, when examined by a lens, with the teeth very short.

Few-haired Cremanium. Shrub 4 to 6 feet.

26. C. tinctorium (D. C. L. c.) quite glabrous; branches nearly terete, furnished with crowded bristles at the knots; leaves petiolate, oval-oblong, rather acuminate, serrulately 3-nerved, coriaceous, shining; thryse panicked, terminal, crowded; petals 6, orbicular. f. S. Native of Peru. The leaves are yellowish, and the whole shrub is used for dyeing yellow by the Peruvians. Calyx bluntly 6-toothed. Stamens rather shorter than the petals. Anthers short, ciliate, very blunt, opening by 2 wide pores at the apex. Stigma peltate. Berry or capsule hardly baccate. Seeds ovate, angular, with a linear hynum.

Dyer's Cremanium. Shrub 4 to 6 feet.

27. C. cruceum (D. C. L. c.) branchlets terete, glabrous; leaves petiolate, ovate, a little serrated at the apex, 5-nerved, glabrous, 3 of the nerves are larger than the other two, and bearded at their origin; petioles rather pilose; panicles terminal, trichotomous; calyx turbinate, 5-toothed. f. S. Native of Peru. Melastoma croceum, Desr. in Lam. dict. 4. p. 55. Spreng. syst. 2. p. 302. exclusive of the variety from Hispaniola.

Copper-coloured Cremanium. Shrub.

28. C. Thiezans (D. C. L. c.) quite glabrous; branchlets terete; leaves petiolate, lanceolate-ovate, a little toothed, 5-nerved, thryse terminal, having its branchlets crowded with flowers; calyx campylanulate, hardly crenate. f. S. Native of temperate places about Popayan. Melastoma Thiezans, Bonpl. mel. t. 9. Flowers white, scented in the evenings. Petals 5 oval. Anthers opening by 2 pores, and minutely appendiculated at the base. At Popayan the leaves of this plant are infused and drank in place of tea by the inhabitants.

Tea Cremanium. Tree 12 to 20 ft.

29. C. latecrenatum (D. C. L. c.) smoothish; branches nearly terete; leaves petiolate, broad-lanceolate, acuminate, broadly and bluntly crenated, 5-nerved, beset with stellate powdery down on the nerves beneath; panicle terminal, clothed with powdery tomentum; calyx with a globose tube and a 5-toothed deciduous limb. f. S. Native of Brazil, in the province of Bahia, in bogs on hills. Very like Melastoma pyramidale, Bonpl. t. 21. but the cream of the leaves are broad and beardless, not acute and ciliate. Melastoma pyramidale, Mart. et Schrank, mss.

Broad-crenated-leaved Cremanium. Shrub 3 to 6 feet.

30. C. inequalis (D. C. L. c.) branchlets from compressed to terete, and are as well as the panicles velvety from short, deciduous, stellate down when young, but at length becoming glabrous; leaves petiolate, oblong, acuminate, sharply and unequally serrated, but entire at the base and apex, 3-nerved; panicule terminal, much branched; branches opposite. f. S. Native of Brazil, in dark woods in the province of St. Paul. Melastoma biserratum, Schrak and Mart, mss. Fruit globose, furrowed, a little larger than a mustard seed. Style short, crowned by an orbicular peltate stigma. Seeds angular.

Unequal-leaved Cremanium. Shrub.

31. C. pusillusorum (D. C. L. c.) branchlets at first rather compressed, but at length terete, and are as well as the pedicels and under side of leaves rather scabrous from distinct, deciduous tufts of small, stellate down, the rest glabrous; leaves petiolate, oblong, acuminate, membraneous, nearly quite entire, 3-nerved, besides the marginal nerves, glabrous; panicule terminal, divaricate, much branched; lobes of calyx 5, short, acute, deciduous. f. S. Native of Brazil, in woods. Melastoma pusillusorum, Mart. et Schrak, mss. Flowers small, white. Anthers oblong, obtuse, each with a slender connective. Style filiform. Fruit globose. Seeds smooth, angular.

Small-flowered Cremanium. Shrub 2 to 3 feet.

32. C. paniculatum (D. C. L. c.) branchlets compressed at length terete, and are as well as the pedicels and nerves of leaves, when young, rather scabrous from small, distinct, stellate tufts of down; the rest glabrous; leaves petiolate, oblong, acuminate, nearly quite entire, almost glabrous, 3-nerved, besides the marginal nerves; panicule terminal, loose, oblong; calyx beset with rather scabrous down: the lobes 5, acute, narrowed, erect, permanent. f. S. Native of Brazil, near Villa Rica. Mel-
MELASTOMACEÆ. LXXVIII. CREMANIUM. LXXIX. BLAKEA.

Panicled-Flowered Cremanium. Shrub 2 to 3 feet.

33. C. LIGNOSUS (D. C. L. c.) smoothish, or the parts while young are beset with small, stellar tufts of down; branchlets compressed, but at length becoming terete; leaves on short pedi-
toles, rather coriaceous, ovate, hardly acuminated, quite entire, or rather repand at the apex, 3-nerved, besides the marginal nerv-
vules; pedicel terminal, much branched; lobes of calyx 5, very short, blunt, and deciduous; berry globose. h. S. Native of Brazil. Melástoma densifrons, níten, ligustrinum, and repándulum, Schrank et Mart. Limb of calyx very short. Petals obovate. Antlers obtuse, opening widely at the top, with the opening separated by a dissection into 2 divisions. Stigma capitately pel-
tate. Seeds few, angular.

Pridet-like Cremanium. Shrub 4 to 6 feet.

34. C. CINNAMOMIFOLIUM (D. C. L. c.) quite glabrous; branches bluntly tetragonall, but at length terete; leaves petiolate, oval, or somewhat ovate, acuminated, 3-nerved, quite entire; thryse contracted, terminal, with its branches angular and opposite; teeth of calyx 5, very short, or almost wanting. h. S. Native of Brazil. Melástoma cinnamomífolium, Mart. herb. but not of Jacq. This species is very nearly related to C. ríbenc, but differs in the flowers being 5-eleft, not 4-eleft, and in the leaves being less attenuated at the base. Stamens seen but not the style.

Cinnamon-leaved Cremanium. Shrub.

Cult. For culture and propagation see Melástoma, p. 764.

Lin. syst. Dodécándria, Monógynia. Calyx campanulate, girded by 4-6 broad scales, which are either disposed in a cru-
ciate manner or in 3 series; limb permanent, membranous, 6-
lobed or 6-toothed. Petals 6. Stamens 12. Anthers large, con
catennated into a ring, obtuse at the apex, and opening by a
two pore, each furnished with a short spur-like process at the base. Capsule laccate, crowned by the calyx, 6-celled. Seeds ovate, angular.—Trees or shrubs. Leaves petiolate, 3-5-nerved, coriaceous, glabrous above and shining, but usually densely clothed with rusty tumensum beneath. Peduncles axillary, terete, 1-flowered, naked, opposite, or solitary, shorter than the leaves, usually clothed with brown tomentum. Flowers large, showy, red.

§ 1. Calyx 6-lobed, girded at the base by 4, rarely by 6

1 B. TRINEÉRIA (Lin. spec. 635.) leaves oval-oblong, 3-nerved, glabrous, and shining on both surfaces in the adult state, and when young serrulate; petioles and branchlets clothed with rusty tumensum; peduncles solitary, longer than the petioles; scales longer than the calyx. h. S. Native of Jamaica; very common on the Port Royal mountains, along with various species of Meriánià. Sims, bot. mag. t. 435.—P. Browne, jam. p. 325. t. 35. Roots issuing from the branches and stems. Flowers large, of a rose colour.

2 B. MEXICANA (D. Don, in mem. wern. soc. 4. p. 325.) leaves elliptic, acute, 5-nerved, dentieulated, pilose beneath; peduncles usually 2 together; scales longer than the calyx. h. S. Native of Mexico. Flowers large, rose-coloured.

Mexican Blakea. Shrub 4 to 6 feet.

3 B. RÓSEA (D. Don, l. c.) leaves oval-lanceolate, acuminated, glabrous; peduncles twin; scales longer than the calyx; petalys mucronate. h. S. Native of Peru. Valdésia rósea, Ruiz et Pav. fl. per. ined. t. 408. Flowers rose-coloured.

Rose-coloured-flowered Blakea. Shrub or tree.

4 B. OVALIS (D. Don, l. c.) leaves oval, acuminated, naked on both surfaces, shining, 3-nerved; peduncles twin; scales longer than the calyx; petals obtuse. h. S. Native of Peru. Valdésia óvalis, Ruiz et Pav. syst. 121. fl. per. ined. t. 406. Flowers red.

Oval-leaved Blakea. Tree 10 to 20 feet.

5 B. REFLNS (D. Don, l. c.) leaves lanceolate, acuminated, 3-nerved, pilose beneath; peduncles twin; scales shorter than the calyx; petals mucronate. h. S. Native of Peru. Valdésia reflens, Ruiz et Pav. syst. p. 121. fl. per. ined. t. 405. Roots issuing from the branches. Flowers red.

Creeping Blakea. Shrub.

6 B. LATIFÓLIA (D. Don, l. c.) leaves large, oval, 3-nerved, acuminated, glabrous; peduncles solitary; scales longer than the calyx. h. S. Native of Peru. Valdésia latifólia, Ruiz et Pav. fl. per. ined. t. 407. Flowers red.

Broad-leaved Blakea. Shrub or tree.

§ 2. Calyx 6-toothed, girded by 4 scales.

7 B. QUINQUÉNÉRVIS (Aubl. guian. 1. p. 525. t. 210.) leaves elliptic, acuminated, naked, and shining on both surfaces, 5-

nerved, the 2 outer nerves near the margin of the leaf, and the other 2 rising above the base of the leaf; peduncles twin, shorter than the petioles; scales longer than the calyx; anthers 16-18; filaments much dilated at the apex; stigma peltate. h. S. Native of Guiana and Trinidad, as well as of Brazil, in woods. B. triploënética, Lin. fl. suppl. Apatíia blakeoides, Desv. in Hamilt. prod. no. 42. Flowers large, de-shcoloured, with white disks. Petals 8-9, unguiculate. Berry large, round, yellow, eatable.

Five-nerved-leaved Blakea. Clt. 1820. Sh. 10 to 16 ft.

8 B. MULTIÓLUM (D. Don, l. c. p. 326.) leaves oval-oblong, short-acuminated, 5-nerved, pilose beneath; peduncles usually 3 together; scales 3-times shorter than the calyx. h. S. Native of Peru. Flowers red.

Many-flowered Blakea. Shrub.

9 B. ROTUNDÓLUM (D. Don, l. c.) leaves large, roundish, 5-

nerved, densely clothed with rusty tumensum beneath, as well as on the branches; peduncles solitary; scales longer than the calyx. h. S. Native of Peru. Leaves 4-7 inches long and 4-6 broad. Flowers red.

Round-leaved Blakea. Shrub.

10 B. MACRÓFÓLIA (D. Don, l. c.) leaves large, oval, 5-

nerved, naked on both surfaces; peduncles solitary; scales longer than the calyx. h. S. Native of Mexico. Leaves a foot long and 7 inches broad. Flowers red.

Long-leaved Blakea. Shrub or tree.

11 B. PARASITICA (D. Don, l. c. p. 327.) leaves roundish, corte-
cate, 5-nerved, mucronate, glabrous and shining above; peduncles short, usually 3 together; scales about equal in length to the calyx. h. S. Native of Guiana and Maranhán. Topôbca parasítica, Aubl. guian. 1. p. 476. t. 189. Shrub climbing and rooting on trees. Flowers red.

Parasitic Blakea. Shrub cl.

12 B. LÁVIGÁTA (D. Don, l. c.) leaves oval, quite entire, 5-

nerved, and are as well as the branches glabrous; peduncles solitary, shorter than the petioles; scales connate at the base,
shorter than the calyx. \( T \). S. Native of Mexico. B. tripinnatis, Pav. ex herb. Lamb. Flowers red.

**Smooth Blkea.** Shrubs.

† *Species hardly known.*

13 B. \( T \) *Pulverulenta* (Vahl. symb. 3, p. 61.) calyx without scales; leaves elliptic, glabrous, triple-nerved; racemes terminal. \( T \). S. Native of South America. See E. Meyer, in act. bomb. 12. p. 797.

**Powdery Blkea.** Shrubs.

14 B. \( C \) *Cačatin* (D. Don, l. c.) branches bluntly quadrangular; leaves ovate, acuminate, 3-nerved; petioles very long, thick both at the base and apex; flowers and fruit unknown. \( T \). S. Native of Guiana, on the banks of rivers. Melastoma Cačatin, Audub. guian. 1. p. 457. t. 172. *Cačatin* is a name given to the plant by the Indians of Guyana.

**Cačatin Blkea.** Shrubs 8 to 10 ft.

*Gult.* The species of this genus are all worth cultivating for the sake of the fine broad foliage, and large showy rose-coloured flowers. They thrive well in peat soil, or a mixture of loam and peat, and require to be liberally supplied with water, particularly in spring and summer. Cuttings should be taken from shoots that are quite ripe, otherwise they are apt to rot; and if planted in a pot of sand, and plunged in a moist heat under a glass-house, they strike root freely.

**Suborder II. Charianthidee (plants agreeing with Charanthus in the anthers opening longitudinally by 2 chinks).** Ser. mss. ex D. C. prod. 3. p. 196. Anthers 2-celled (\( f \) 113. \( c \)), opening longitudinally by a double chink (\( f \) 113. \( c \)). Fruit fleshy. Seeds cuneate, angular.

**LXXX. Kibeśsia** (Kibessia is the name given to this plant by the Javanese). D. C. prod. 3. p. 196. Blume, in bot. zeit. 1851. no. 80. p. 552.

**Lin. syst.** Octándria, Monogyñia. Tube of calyx nearly hemispherical, muricated from branched bristles, adnate to the ovarium; limb divided, calyctriforin, cut round about at the base, and falling off in one piece. Petals 4, obovate. Stamens 8, equal. Anthers ovate, opening by a longitudinal double chink, fleshy on the back and without any appendage. Style filiform, tapering to the apex; stigma simple. Fruit nearly globose, depressed at the apex, and hence umbicate, indehiscent, 4-celled. Seeds cuneate, angular.—A large, glabrous shrub, with terete branches, but rather tetragonal towards the apex.

**Lin. syst.** Octándria, Monogyñia. Tube of calyx ovate, rather urceolate (\( f \) 113. \( a \)); limb spreading, bluntly 4-lobed, permanent. Petals 4, erect, oval. Stamens 8, nearly equal; filaments linear (\( f \) 113. \( b \)); anthers continuous with the filaments (\( f \) 113. \( c \)), oblongly club-shaped, naked at the base, opening longitudinally by a double chink (\( f \) 113. \( c \)). Ovary adnate to the calyx (\( f \) 113. \( c \)). Style filiform, exerted. Capsule baccate, globose, umbilicate, 4-celled, opening a little at the apex by the valves. Placentas lunate. Seeds ovate, with a large lateral hilum. Albumen none. Embryo straight, with thick cotyledons, and a long, inferior radicle.— Erect, West Indian shrubs, with petiolate, 5-nerved leaves, and purple flowers, which are disposed in trichotomous, corymbose cymes.

1 C. **oecon*es* (D. Don, l. c.) all parts of shrub rather pubescent when young, but at length becoming quite glabrous; branches nearly terete; leaves ovate, acuminate, quite entire, 5-nerved, beset with flectly down beneath or small dots. \( T \). S. Native of Guadaloupe and Cayenne, on the higher mountains, in spaghnum places. Melastoma cocina, Rich. in act. soc. hist. nat. par. 109. and in Bonpl. mel. t. 44. Melast. alpina, Swartz, fl. ind. occ. 2. p. 800. The dots on the lower surface of leaves are the cicatrizes, occasioned by the falling off of the tufts of stellate down. Calyx dotted from flectly down when young, but quite glabrous in the adult state. Flowers scarlet.

**Sclaret-flowered Charianthus.** Shrubs 4 to 6 feet.

**Quite-glabrous Charianthus.** Shrubs 4 to 6 feet.

3 C. **tiniflólius** (D. Don, l. c.) leaves ovate, coriaceous, obtuse, short-acuminate, 5-nerved, quite entire, glabrous on both surfaces, as well as on the branches. \( T \). S. Native of the West Indies Islands. Flowers blood-coloured. Lateral nerves of leaves almost obsolete.

**Laurestinus-leaved Charianthus.** Shrubs 4 to 6 feet.

4 C. **purpureus** (D. Don, l. c.) branches and petioles hispid from bristles; leaves ovate, short-acuminate, cordate at the base, quite entire, 5-nerved, pilose beneath and on the margins. \( T \). S. Native of the Island of Montserrat. Melastoma coccina, Vahl. ecol. 1. p. 48. icon. amer. t. 16. but not of Rich. Flowers purplish red.

**Purple-flowered Charianthus.** Shrubs 4 to 6 feet.

5 C. **ciliátus** (D. C. prod. 3. p. 197.) branches hispid from bristles; leaves ovate, coriaceous, short-acuminate, glabrous on both surfaces, 5-nerved, serrated, with the serrature callous and ciliate toothed. \( T \). S. Native of Trinidad. Sieb. pl. trin. no. 279. Tetrazygos ciliatus, Rich. herb. Melastoma Dodandiana, Hamilt. prod. p. 37. Flowers purple.

**Ciliated-leaved Charianthas.** Shrubs 3 to 6 feet.

*Gult.* All the species of Charianthus are worth cultivating for their showy cymes or corylms of purple or scarlet flowers. Their culture and propagation are the same as recommended for Blkea, see *p. 801.*

**LXXXII. Chenopleura** (from *\( ov \) sos, chaim, to open, and *\( n \) euras, pleura, a side*). Rich. herb. ex D. C. prod. 3. p. 197.

**Lin. syst.** Decándria, Monogyñia. Calyx adnate to the 5 K
MELASTOMACEÆ. LXXXII. Chemosperma. LXXXIII. Erwylia. LXXXIV. Astronia.

ovarium; limb bluntly 5-toothed. Petals 5, roundish. Stamen 10, hardly longer than the petals. Anthers opening longitudinally by 2 slits; having their connectives basilarieulate at the base. Style clavate, crowned by an orbicular, somewhat lobulate stigma. Berry 1-4-celled. Seeds unknown.—Glabrous shrubs, with the habit of the section Leuophylla of Mélastomaceae. Leaves petiolar, oblong-lanceolate, obtuse at the base, acuminate at the apex, denticulated from hair-formed, distinct serrations, 3-nerved or almost triple-nerved. Thyrs terminal, elongated, having its branches opposite and almost racemose. Flowers from white to flesh-coloured. Bracteoles and segments of calyx ciliated.

1 C. stenobryus (D. C. prod. 3. p. 197.). S. Native of Hispaniola, on the mountains, and probably of Jamaica. Mélastoma stenobryus, Rich. in Bot. misl. t. 30, exclusive of the synonym of Swartz.

Narrow-racemed Chemosperma. Sh. 4 to 6 feet.

Cult. For culture and propagation see Melastoma, p. 764.

Lin. syst. Octandria, Monogynia. Tube of calyx hemispherical, adhering to the ovary; limb continuous with the tube, obliquely 5-toothed. Petals 4, ovate, acute. Stamens 8, equal. Anthers oblong, obtuse at both ends, opening by a double slits, furnished behind at the base with a fleshy connective. Style filiform; stigma acute. Berry globose, crowned by the limb of the calyx, 4-celled. Seeds cuneate, angular.—A smooth shrub or small tree. Branches terete, but thickened at the knots. Leaves opposite, on short petioles, elliptic, acuminate at both ends, quite entire, 3-nerved. Racemules axillary, few-flowered; pedicels bracteolate in the middle. Flowers small, blue.

Blume-flowered Erwylia. Shrub.

Cult. For culture and propagation see Blakia, p. 801.

Lin. syst. Deca-Dodecandria, Monogynia. Tube of calyx hemispherical, adhering to the ovary; limb 5-6-toothed. Petals 5-6, obovate, obtuse. Stamens 10-12, equal. Anthers linear-oblong, opening by a double slits, inapplicable, adnate to the thick, triangularly-compressed connectives. Style filiform; stigma peltate. Capsule dry, 2-4-celled, crowned by the limb of the calyx, opening irregularly lengthwise. Seeds straight, paleaceous, enveloped in fine aril.—Glabrous trees. Branches tetragonal, beset with small, brownish scales or dots at the tops as well as on the petioles, peduncles, and calyces. Leaves opposite, on longish petioles, oblong, acuminate, quite entire, 3-nerved or triple-nerved, discoloured. Inflorescence panicled, terminal, and axillary. Flowers small, purplish, unisexual from abortion.

1 A. spectabilis (Blume, l. c.) leaves 3-nerved, oblong, acuminate, obtuse at the base, thickly beset with rust-coloured scales or dots beneath. S. Native of Java, in woods on the higher mountains, where it is called Kikariedung.

Shiny Astronia. Tree.

2 A. papata (Blume, in bot. Zeit. l. c.) leaves 3-nerved, oblong, acuminate, attenuated at the base, thickly beset with russet-dots beneath. S. Native of Amboyna. A. spectabilis, Zippel ined. Phâlmaeum papata, Rumph. amb. 4. p. 194. t. 69. Oebat papeba is the Malay name of the tree.

Papetaria Astronia. Shrub.

3 A. macrophylla (Blume, l. c.) leaves triple-nerved, beset with fagaceous scattered down beneath. S. Native of Java and the Moluccas. Var. ß, disolor; leaves 3-nerved or obscurely triple-nerved. Java.

Var. γ, concolor (Blume, in bot. Zeit. l. c.) leaves nearly of the same colour on both surfaces, beset with very small dots beneath and on the branchlets. S. A. concolor, Zippel, ined. Long-leaved Astronia. Tree.

Cult. For culture and propagation see Blakia, p. 801.

† The structure of the following Mélastomaceous plants is not known, and therefore they are ranged here according to the names they have first received.

§ 1. Plants referred by authors to Rhéxia, from the fruit being capsular.

* Flowers deciduous.

1 R. fulva (Spreng. syst. 2. p. 308.) shrubby; branches dichotomous, pubescent; leaves oblong, minute, almost nerveless, beset with hispid bristles; flowers deciduous, terminal, solitary; calyce lobes subulate. S. Native of Brazil.

Fulvous Rhéxia. Shrub.

2 R. fasciculata (Spreng. neue. entd. 3. p. 62. et syst. 2. p. 308.) racemes rather dichotomous, terminal; leaves linear-oblong, in fascicles, quite glabrous, nerveless, with 1 tooth on each side; corolla blood-coloured; calyx 10-stippled, strigose. S. Native of Brazil. Perhaps a species of Cambessedesia. Fascicled-leaved Rhéxia. Pl.

* * * Flowers octandrous.

3 R. helvola (Spreng. syst. 2. p. 309.) suffruticosus; leaves crowded, sessile, oval, quite entire, beset with pale red, stiff hairs or bristles on both surfaces; peduncles axillary, cymose; flowers octandrous; calyxes very hispid. S. Native of Brazil.

Pale-red-haired Rhéxia. Shrub.

4 R. trichomosa (Rottb. diss. pl. rar. 9. t. 5.) shrubby; branches tetragonal; angles hairy; leaves sessile, lanceolate, hairy; flowers sessile, axillary, and terminal. S. Native of Surinam. Vahl symb. p. 48.

Trichomose Rhéxia. Shrub.

5 R. striata (Willd. herb. ex Spreng. syst. 2. p. 309.) suffrutosus; leaves ovate, 3-nerved, strigose; peduncles axillary, corymbose; flowers octandrous; calyxes hairy. S. Native of Cayennne.

Strigose Rhéxia. Shrub.

§ 2 Plants referred by authors to Melastoma, from their fruit being fleshy.

* * * * Flowers octandrous.

1 M. melanophyllum (Spreng. neue. entd. 2. p. 171.) branches knotted, nearly terete; glabrous; leaves ovate, acuminate, quite glabrous on both surfaces, 3-nerved, quite entire, shining above; panicles lateral; flowers octandrous; calyx with 4 minute teeth, covered with stellate scales. S. Native of Brazil.

Black-leaved Mélastoma. Shrub.

2 M. sessile (Spreng. syst. 2. p. 308.) branches twigg; leaves half stem-clasping, roundish-cordate, acute, quite entire, obliquely triple-nerved, beset with glandular villi on both surfaces; flowers almost sessile, axillary, octandrous. S. Native of Brazil. Perhaps a species of Segre'sa.

Sessile-flowered Mélastoma. Shrub.

3 M. virgatus (Swartz, prod. p. 72. fl. ind. occ. 2. p. 816.)
branches twiggy, tetragonal, glabrous; leaves ovate-lanceolate, acuminate, 3-nerved, entire; flowers white, octandrous; calyx 4-toothed, the teeth subulate; petals oblong, longer than the calyx; filaments united among the anthers; stigmas acute. \( \gamma \). S. Native of Jamaica, in woods on the mountains.

**Twiggy Melastoma.** Shrub.

4 M. Matuch'na (Spreng. nev. centd. 3. p. 61.) leaves ovate, 3-nerved, acuminate, glabrous, quite entire; panicle terminal, with trichotomous, erect branches; calyx terete, truncate. \( \gamma \). S. Native of Guadaloupe and Antigua.

**Matuba Melastoma.** Shrub.

5 M. mi casa stium (Swartz, prod. p. 71. fl. ind. occ. 2. p. 803.) branches twiggy, terete, glabrous; leaves oblong, acuminated at both ends, glabrous, 3-nerved, denticulated, petiolate; racemes axillary, reclinate towards the top of the branches; flowers white, octandrous; calyx 4-toothed; petals 4, acuminated, with a blood-coloured spot at the base of each; berry 3-sided, 4-celled, white and pellucid at maturity. \( \gamma \). S. Native of Jamaica, on the mountains. Perhaps a species of *Oste'a*.

**Small-flowered Melastoma.** Shrub.

6 M. triflorum (Vahl. ecol. fasc. 1. p. 46.) branches, pediwoles, and calyces strigose; leaves elliptico-lanceolate, quite entire, 3-nerved; flowers axillary, octandrous, somewhat pedunculated, tern; calyx turbinate, obscurely 4-toothed; petals ovate, exceeding the stamens. \( \gamma \). S. Native of the West Indies.

**Thrice-flowered Melastoma.** Shrub.

7 M. triplinervia (Link, et Otto. Icon. pl. rar. hort. berol. t. 24.) stems branched; leaves ovate, bluntish, somewhat feather-nerved towards the apex, tapering into the petiole at the base; hairs adpressed; panicles terminal; calyx with 4 acuminate lobes. \( \gamma \). S. Native of Mexico, at Xalapa. Flowers white. Leaves, petals, and sepals ciliolate.

8 M. eostatum (Ait. hort. kew. ed. 3. p. 46.) leaves ovate-lanceolate, acuminated, denticulated, without ribs, triple-nerved, pilose above, but smoothish beneath; corymsbs terminal, trichotomous; branches, peduncles, and calyces clothed with powdery tomentum; flowers octandrous. \( \gamma \). S. Native of Jamaica.

**Ribless Melastoma.** Shrub 1 to 2 feet.

9 M. Salicinum (Ser. mss. in D. C. prod. 3. p. 199.) branches terete, and are as well as the petioles, nerves of leaves, peduncles, and calyces clothed with long, rufous, rather adpressed bristles; leaves oblong-lanceolate, acuminate at both ends, 3-nerved, with the margins revolute; thyrse terminal; lobes of calyx 4, narrow, acuminated. \( \gamma \). S. Native of Brazil. Perhaps a proper genus, belonging to Tribe Miconieae. It is not a *Clidemia*, from the ovarium being glabrous at the apex: nor a *Miconia*, from the calyx being 4-cleft.

**Willow Melastoma.** Shrub 3 to 6 feet.

10 M. *x* cuv (Rudolph, in Schrad. nev. neuns, journ. vol. 2. pt. 2. p. 293.) branches nearly terete, smooth; branches hoary; leaves ovate, acuminate, obsolesly denticulated, 5-nerved, covered with strige above, and reticulately tomentose beneath; panicles terminal, divaricate; flowers ocyandrous; calyx 4-toothed; petals oblong, purple, with undulated margins; anthers acuminated. \( \gamma \). S. Native of Jamaica, on the mountains.

**Painted Melastoma.** Shrub 3 to 6 feet.

11 M. crinem (Vahl. ecol. fasc. 3. p. 28.) branches terete, glabrous below, leafless at the apex, hispid from white pili; leaves oval-oblong, denticulated, hispid on both surfaces; flowers octandrous; tube of calyx short, tetragonal; angles acuminate, gibbous at the base; calypike segments, 4, awned beneath the apex; genitally length of corolla. \( \gamma \). S. Native of Martinico, on the mountains. Perhaps a species of *Clidemia*.

### Hairy Melastoma. Shrub.

* * Flowers decandrous.

**A. Species natives of the West Indies.**

12 M. *expansum* (Vahl. ecol. fasc. 3. p. 21.) branches terete, glabrous below; leaves oblong-obovate, attenuated, setaceous denticulated, glabrous, 5-nerved; racemes compound, powdery; flowers decandrous; pedicels dichotomous; calyx campanulate, obscurely striated, 5-toothed; petals 5, linear-oblong, obtuse; stamens longer than the corolla. \( \gamma \). S. Native of the Island of Montserrat. Perhaps a species of *Micénia*, allied to *M. pyramidale*.

**Expanded Melastoma.** Shrub.

13 M. *capitatum* (Vahl. ecol. fasc. 3. p. 21.) branches terete, compressed towards the apex; leaves broad-lanceolate, quite entire, obtuse at the base, acuminated at the apex, 5-nerved, pilose, petiolate; heads of flowers terminal, involucrated; bracteas membranous, lanceolate, pilose on the back, about the length of the calyx; calyx glabrous, tubular, pilose at the base; having lanceolate, ciliated segments; petals oblong, longer than the calyx; filaments with 2 appendages each; ovarium elongated, beset with setaceous pili at the apex. \( \gamma \). S. Native of the West Indies. Perhaps a species of *Clidégastra*.

**Capitate-flowered Melastoma.** Shrub.

14 M. *nervosum* (Smith in Rees' cyclo. vol. 23.) stem terete, bristly; leaves elliptico-oblong, acute, crenated at the base and apex, 5-nerved, villous; flowers in glomerated spikes. \( \gamma \). S. Native of Jamaica. Allied to *Micénia alata* according to Smith.

**Nerved-leaved Melastoma.** Shrub.

15 M. *splendens* (Swartz. prod. p. 70. fl. ind. occ. p. 789.) branches nearly terete, glabrous; branches rusty; leaves oblong, acuminated, glabrous on both surfaces, 5-nerved, entire, shining above; flowers in umbellcate panicles, small, almost sessile; calyx 5-toothed; petals 5, oval, white, stigma capitulate, depressed; berry blue minute. \( \gamma \). S. Native of Jamaica, in woods on the mountains. Plum, ed Burm. t. 140. ex Swartz. Perhaps a species of *Micénia*.

**Splendid Melastoma.** Shrub.

16 M. *tavusum* (Destr. in Larn. dict. 4. p. 47.) branches clothed with rufous rather scurfy tomentum; leaves ovate, rather cordate, denticulated, 5-nerved, large, lacunose beneath, and with many angled tubercles above; flowers corymoso terminal; calyx rounded at the base, 10-angled, bluntly 5-toothed; petals red, longer than the calyx. \( \gamma \). S. Native of St. Domingo. Perhaps a species of *Clidémia*.

**Pitted-leaved Melastoma.** Shrub.

17 M. *piluliferum* (Vahl. ecol. fasc. 3. p. 15.) branches obscurely tetragonal, glabrous, spreading; branches compressed, clothed with rufous powdery tomentum; leaves lanceolate-elliptic; calyx 10, quite entire, glabrous, petiolate; flowers spicate, decandrous; spikes bipartite, in a somewhat compound raceme; bracteas setaceous; calyx 5-toothed, striated; stamens longer than the corolla; berries glabrose, twice the size of a mustard seed. \( \gamma \). S. Native of Martinico. Perhaps a species of *Micénia*.

**Pill-bearing Melastoma.** Shrub.

18 M. *trinevium* (Swartz, fl. ind. occ. p. 774.) quite glabrous; branches somewhat tetragonal; leaves petiolate, oblong, attenuated at both ends, 3-nerved, without any marginal nerves; thyrse terminal, loose, panicled; racemes bipartite; flowers crowded, sessile, decandrous. \( \gamma \). S. Native of Jamaica, on the mountains. Calyx, petals, fruit, and genitils undescribed.

**Three-nerved-leaved Melastoma.** Shrub.

19 M. *virensens* (Vahl. ecol. fasc. 3. p. 18.) branches 5 k 2
terete, greenish, glabrous, rather compressed above, and beset with rather powdery villi; leaves obovate-lanceolate, dentilicate, glabrous, smooth, 3-5-nerved; spikes terminal, racemose, bipartite; flowers secund, decandrous; calyx somewhat campanulate, 5-toothed, powdery; anthers linear, curved, furnished at the base on one side with a short brown auricle; style length of stamens, but longer than the corolla; berry globose, about the size of a mustard seed. \( \gamma. S. \) Native of the Island of Trinidad.

**Greenlea Melastoma.** Shrub small.

20 M. \( \text{iopoides} \) (Swartz, prod. p. 69. fl. ind. occ. 2. p. 768.) shrub with very straight tetragonal branches, clothed with rusty scurfy down towards the apex; leaves ovate, cordate, dentilicate, petiolate, 3-nerved, stiff, rather membranous, glabrous, brittle; racemes terminal, many-flowered, beset with rusty hairs; flowers decandrous; calyx ovate, hairy, 5-toothed; teeth short, obtuse, stiff; petals ovate, white; stamens longer than the corolla; filaments keeled on the back; style short, thick, striated; stigma obtuse; berries roundish, clothed with rusty færia. \( \gamma. S. \) Native of Jamaica, on the highest mountains.

**Stiff Melastoma.** Shrub.

21 M. \( \text{christophoria} \) (Hamilt. prod. fl. ind. occ. p. 37.) stems bushy, glabrous, erect; leaves obovate, acute, quite entire, green above and white beneath, triple-nerved; flowers decandrous, panicked, terminal; peduncles rather trichotomous. \( \gamma. S. \) Native of the Island of St. Christopher. Flowers small, red.

**St. Christopher Melastoma.** Shrub.

22 M. \( \text{sessiliflorum} \) (Lin. spec. 558.) leaves oblong-spatulate, sessile, entire, 3-nerved, tomentose beneath; fascicles of flowers scattered. \( \gamma. S. \) Native of Jamaica.—Pluk. phyt. t. 249. f. 2.

**Sessile-flowered Melastoma.** Shrub small.

23 M. \( \text{brachiatum} \) (Vahl, eclog. fasc. 3. p. 24.) branches smooth, terete; branchlets compressed, clothed with rusty powdery down; leaves elliptic, attenuated, dentilicate, glabrous, 3-nerved; nerves powdery beneath; spikes bipartite, racemose, second; calyx about the size of a black pepper, sulcate, globose when the fruit is ripe; petals small, obovate; flowers decandrous. \( \gamma. S. \) Native of Montserrat.

**Armed Melastoma.** Shrub 4 to 6 feet.

24 M. \( \text{striatum} \) (Vahl, eclog. fasc. 3. p. 14.) branches glabrous, powdery, and compressed towards the top; leaves obovate-oblong, attenuated, glabrous, toothed, 3-5-nerved; racemes terminal, compound; pedicels 3-flowered; calyx glabrous, truncate or 5-lobed; lobes rounded; petals 5, wedge-shaped; stamens length of the petals. \( \gamma. S. \) Native of Montserrat.

**Striated Melastoma.** Shrub 4 to 6 feet.

B. **Species natives of Guiana.**

25 M. \( \text{pseudocolpium} \) (E. Meyer, in act. bonn. 12. p. 705.) branches terete, a little striated; leaves oblong, acuminate, serrulate, ciliated, truncate at the base, 5-nerved, rather pilose; panicle terminal; flowers glomerate, decandrous; calyx glabrous, 10-ribbed, 5-toothed; anthers with long beaks, bicellulous at the base; berry 3-celled, crowned by an entire margin. \( \gamma. S. \) Native of Surinam. Petals obvate, conceave.

**Ribbed-fruited Melastoma.** Shrub.

26 M. \( \text{fraile} \) (Lin. fil. suppl. 236.) leaves ovate, serrated, rather petiolate, 5-nerved, smooth, ciliated, very brittle; lower peduncles trifid; pedicels usually 2-flowered; flowers decandrous, rather secund; berry pea-formed, glabrous. \( \gamma. S. \) Native of Brazil, Mexico, and Surinam.

**Brittle-leaved Melastoma.** Shrub.

27 M. \( \text{brennus} \) (Vahl, eclog. fasc. 3. p. 19.) shrub with terete branches, and tetragonal branchlets; leaves oval, ciliated, secrabous above, but hoary beneath, petiolate, 3-5-nerved; flowers decandrous, aggregate beneath the leaves, rather pedunculate and strigose; calyx oblong, with rufescent stripes, and with 5 ovate oblong segments; petals roundish, length of the segments of the calyx; stamens length of corolla; style ciliate, crowned by an oblong stigma. \( \gamma. S. \) Native of Guiana.

**Brown-calyx Melastoma.** Shrub.

28 M. \( \text{grossularoides} \) (Lin. spec. 558.) leaves roundish-ovate, acuminate, denticulated, 3-nerved, glabrous on both surfaces; flowers decandrous. \( \gamma. S. \) Native of Surinam.—Pluk. alm. 40. t. 249. f. 4.

**Goosberry-like Melastoma.** Shrub.

29 M. \( \text{icosandrum} \) (Swartz, herb. ex Wikst. fl. guad. in acad. de stockh. 1827.) leaves ovate or lanceolate, acuminate, crenulately, 3-nerved, glabrous; branches of panicle 3-parted; flowers incandescent. \( \gamma. S. \) Native of Guadaloupe.

**Iconis Melastoma.** Shrub.

30 M. \( \text{punctatum} \) (Swartz, herb. ex Wikst. 1. c.) leaves opposite, ovate, quite entire, 3-nerved, glabrous, full of elevated dots beneath; cymes terminal, contracred, few-flowered; calyx glabrous, 5-crenated. \( \gamma. S. \) Native of Guadaloupe.

**Dotted-leaved Melastoma.** Shrub.

31 M. \( \text{farinulatum} \) (Swartz, herb. ex Wikst. 1. c.) leaves scattered, ovate, attenuated, quite entire, 3-nerved, beset with adpressed dots beneath, rather mealy; raceme straight, trifidly 3-parted; flowers pedicellate, decandrous. \( \gamma. S. \) Native of Guadaloupe.

**Mealy Melastoma.** Shrub.

C. **Species natives of Brazil.**

32 M. \( \text{radulatum} \) (Hoffmanns. verz. 1826. p. 150.) stem terete, somewhat articulated, bluntly 4-winged; leaves petiolate, ovate, acuminate, 3-nerved, somewhat denticulated, rough above, and beset with deciduous hairs beneath; flowers cy-mose; calyx ovate, somewhat pentagonal, beset with somewhat inbricate tubercles and adpressed hairs. \( \gamma. S. \) Native of Brazil. Perhaps a species of *Lasianthus* or *Macarea*.

**Rasp-leaved Melastoma.** Shrub.

33 M. \( \text{brasiliense} \) (Sprêng. syst. 2. p. 297.) leaves lanceolate, acuminate, quite entire, hoary beneath, as well as the branches and calyces from stellate down; branches of panicle divaricate. \( \gamma. S. \) Native of Brazil.

**Brazilian Melastoma.** Shrub.

34 M. \( \text{serrulatum} \) (Sprêng. syst. 2. p. 300. but not of Pav.) leaves oblong, acute, serrulate, ciliate, clothed with fulvous hairs on both surfaces, and on the branches; panicle terminal, trichotomous, with divaricate branches. \( \gamma. S. \) Native of Brazil.

**Serrulate-leaved Melastoma.** Shrub.

35 M. \( \text{peteroni} \) (Schrank et Mart. mas.) shrubby, glabrous, ovate, acuminated, 5-nerved, beset; leaves oval-oblong, tapering much into the petiole, acuminate at the apex, triple-nerved or almost quintuple-nerved; flowers almost sessile, crowded, axillary; fruit globose; calyx lobes 5-6, deciduous. \( \gamma. S. \) Native of Brazil, in the woods of Tapura. The nerves on the lower leaves are nearly marginal, and those on the upper leaves are as in *Miconia spondylanthus*, rising far above the base, and somewhat alternate. Petals and stamens unknown. Perhaps a proper genus.

**Variable-nerved Melastoma.** Shrub.

D. **Species natives of New Grenada.**

36 M. \( \text{squamosulorum} \) (Smith in Rees' cyclo. vol. 23.) leaves elliptic, obtuse, 5-nerved, entire, smooth above, but covered with scale-like hairs beneath; flowers panicled, terminal, dense;
MELASTOMACEÆ.

805
calyx turbinate, 10-ribbed, bluntly 5-toothed, scaly; petals roundish, yellow; berry furrowed, villous. ♂. S. Native of New Granada. Perhaps a species of Dèova.

806

Scaly Melastoma. Shrub.

37 M. zigzagium (Smith in Rees' cycl. vol. 23.) stem and branches glabrous; leaves oval, obtuse, entire, 3-nerved, glabrous, petiolate, shining above, yellowish beneath; flowers terminal, panicked, dense; calyx hemispherical, glabrous, striated, broadly and bluntly toothed; petals obtuse, small, white or reddish; anthers obsolete; style obtuse; stigma hollow; berry small, yellow. ♂. S. Native of New Granada. Allied to M. squamulosa ex Smith.

Priet-like Melastoma. Shrub.

38 M. orosum (Lin. fil. suppl. 236.) branches stiffish, terete, hispid; leaves quite entire, 5-nerved, rather cordate, covered with scabrous tomentum; flowers large, terminal; calyx striate; petals rather pilose on the outside. ♂. S. Native of New Granada.

Large Melastoma. Shrub.

39 M. laevigatum (Humb. et Bonpl. mol. 1. p. 105, t. 45.) stems weak, flexuous; leaves lanceolate, awnless, ciliated, 3-nerved, clothed with scaly down and rufescent hairs beneath, as well as on the branchlets; raceme terminal, loose, few-flowered; flowers deciduous; calyx rather globose, with 5 little teeth; berry small, globose, 3-celled. ♂. S. Native of New Granada, on Mount Quindiu, near Ibague. Genitals unknown. Perhaps a species of Clidemia or Tschudyia.

Ibage Melastoma. Shrub 10 feet.

40 M. globiflorum (Cham. et Schlecht. in Linnaæ. 5. p. 564.) clothed with hairy tomentum; branches terete; leaves petiolate, 5-nerved, ovate-elliptic, acuminate, hairy above, but yellowish beneath; racemes terminal; its branches bearing bundles of flowers at their tops; calyx urceolate, 5-toothed; petals 5, emarginate; stamens 10; anthers opening by one pore, without appendages; ovary glabrous; style thickish; stigma dotted; berry 5-celled, many-seeded, crowned by the teeth of the calyx; seeds yellowish, 3-sided, with a blackish hylum. ♂. S. Native of Mexico, in woods about Jalapa. Tomentum on the stem, tops of branches, and under side of the leaves stellate, and on the upper side simple. Berry hairy.

Globe-flowered Melastoma. Shrub 4 to 6 feet?

41 M. scrobiculatus (Cham. et Schlecht. in Linnaæ. 5. p. 564.) leaves on short petioles, membranous, ovate, acuminate, glabrous above, but clothed with scurfy down beneath, 3-nerved or triple-nerved; racemes terminal, elongated, constantly composed of twisted cymes; flowers almost sessile, second, small, decurved; anthers opening by one pore, shortly auricled at the base; stigma peltately funnel-shaped. ♂. S. Native of Mexico, at Cuesta Grande de Chiquinique. Down on the branches and lower surface of leaves rather scurfy, intermixed with a few fine stellate down.

Scorpion-like Melastoma. Shrub.

42 M. conoides (Cham. et Schlecht. Linnaæ. 5. p. 563.) glabrous; branches terete; leaves petiolate, oval-lanceolate, acuminate, 3-nerved, puberulous, ciliated, membranous; cymes axillary, or nearly terminal, triquetrous, loose, and few-flowered, having the branches filiform, bracteolate; berries globose, 5-ribbed; ribs running down from the teeth of the calyx. ♂. S. Native of Mexico, near Jalapa in woods. Habit of Clidemia agristis. Seeds small, yellowish, with a black nearly linear hylum. Stamens 10; anthers not appendiculated, opening by one pore at the apex. Perhaps a species of Clidemia.

Dogwood-like Melastoma. Shrub. 2 to 3 ft.

43 M. furfuraceum (Vahl, eclog. fasc. 3. p. 13.) leaves oblong, glabrous, smooth, quite entire, petiolate, 3-nerved, acuminate; branches and peduncles clothed with scurfy tomentum; racemes simple; pedicels 3-flowered; flowers almost sessile, decandrous; calyx 5-toothed; teeth minute; petals 5, oblong; style length of the stamens. ♂. S. Native of South America.

Scurfy Melastoma. Shrub.

*** The number of stamens and parts of the flower are unknown in the following species.

44 M. myricoides (Desr. in Lam. dict. 4. p. 51.) smoothish; branches tetragonal, knotted at the joints; leaves ovate, smoothish, somewhat acuminate, denticulated, 3-5-nerved, small, almost sessile, rather villous beneath; flowers trichotomously panicked; fruit globose, glabrous, granular. ♂. S. Native of the Antilles.

Myrica-like Melastoma. Shrub.

45 M. thyrsoides (Vahl, eclog. fasc. 3. p. 13.) glabrous; leaves oblong-ovate, attenuated at both ends, glandularly denticulated, 3-nerved; racemes terminal, decomposed; peduncles tetragonally compressed; flowers small; bracteate linear; calyx globose, truncate. ♂. S. Native of Montserrat.

Thyrses-like-flowered Melastoma. Shrub.

46 M. cu'krellum (Smith in Rees' cycl. vol. 23.) leaves oval-elliptic, acute, entire, on short petioles, 3-nerved, smoothish above, but clothed with rufous tomentum beneath, as well as the pedioles and peduncles; flowers dichotomously panicked, very numerous, and very minute; calyx glabrous. ♂. S. Native of the Caracas?

Copper-coloured Melastoma. Shrub.

47 M. abscendens (Swartz, fl. ind. occ. 2. p. 772.) shrub sarmentose, twining, rooting; branches tetragonal, pubescent; leaves ovate, acute, glabrous, 3-nerved, denticulated; raceme ovate, terminal; racemes bearing the flowers on one side; calyx tubular, with its limb membranous and 4.5-5-sided, and with 4-5 truncate teeth; petals oblong, obtuse; stamens 8-10; anthers opening by 2 pores at the apex, and sheathed at the base; fruit oblong, 5-celled. ♂. S. Native of Jamaica, in mountain woods. M. scandens, Swartz, prod. p. 69, but not of Aubl. Perhaps a proper genus allied to Merandria.

Ascending Melastoma. Shrub cl.

48 M. nodosum (Desr. in Lam. dict. 4. p. 55.) blackish; branches somewhat tetragonal, knotted; leaves elliptic, serrulately ciliated, 5-nerved, coriaceous; flowers in trichotomous corymbs, bracteate; peduncles hispid; calyx campanulate, angular at the base, crenated, length of the corolla. ♂. S. Native of the Antilles.

Knotted Melastoma. Shrub.

49 M. paradoxum (Mart. herb. ex D. C. prod. 3. p. 202.) shrubby, quite glabrous; branches much compressed between the knots; leaves petiolate, coriaceous, oval, somewhat cordate at the base, 3-5-nerved, with the margins nerve-formed, pale beneath; panicle terminal; fruit globose. ♂. S. Native of Brazil, on Mount Arara-Cooara. Seeds 3-sided, smooth. Habit of Toecda, but the bladders on the pedioles are wanting. The calyx is 4-sided.

Paradoxical Melastoma. Shrub.

§ 3. Alternifolius. The leaves being alternate in the following species, it is therefore evident that it should be excluded from the order altogether.

1 RHÉXIA JUSSIELIÓIDES (Lin. fil. suppl. 215.) pubescent; leaves lanceolate, alternate? ribbed, with the margins scabrous from very minute serrature; flowers solitary, axillary, octandrous; calyxine segments 4, lanceolate, acute; petals ovate, exceeding the calyx, yellow; genitals inclinate, shorter than the corolla; filaments short; stigma warted; capsule somewhat
tetragonal, 4-celled. f. S. Native of Surinam. This plant most probably belongs to some genus of Onagraéce.

Jussica-like Rhexia. Shrub.

† An additional species of Arthrostémmum.

3 Arthrostémmum ñíduma (Graham in ed. phil. journ. dec. 1831. Hook. bot. mag. 3142.) stems shrubby, erect, and are, as well as the branches, tetragonally winged, beset with coloured hairs; leaves ovate, acute, serrated, glabrous on both surfaces, shining above, but glabrously hispid on the nerves beneath; peduncles axillary towards the top of the branches, 3-flowered, longer than the petals; petals obvolute, retuse; anthers dissimilar, with their connectives short and biauriculate. f. S. Native of Buenos Ayres. Flowers lilac.

Order XCIX. ALANGIEÆ (see genus for derivation). D. C. prod. 3. p. 103. Tube of calyx egg-shaped, rather constricted at the apex; limb campanulate, 5-10-toothed. Petals 5-10, linear, spreadingly reflexed. Stamens much exerted, double or quadruple the number of the petals; filaments free, filiform, very villous at the base. Anthers adnate, linear, 2-celled, bursting inwards by a longitudinal double chink, often barren. Disk fleshy at the base of the limb of the calyx. Drupe oval, somewhat crowned, fleshy, a little ribbed, and somewhat tomentose, containing a valveless 1-celled nut, the bone or stone having a hole at its apex. Seed one (or 3, ex Rheede), inverted, ovate, with fleshy friable albumen. Embryo straight, with a long ascending radicle, and flat foliaceous ovate-cordate cotyledons.—Shewy Indian trees, with the branches often spinescent. Leaves alternate, exstipulate, ovate-lanceolate, acuminate, feather-nerved, quite entire, dotless, similar to those of Grènia. Flowers few, sessile, in axillary fascicles. Fruit edible.

This order is only composed of one genus, whose place in the natural system is very doubtful. It differs from Myrtáceæ in the greater number of petals, in the adnate anthers, in the one-celled fruit, and in the albuminous pendulous seeds. It agrees with Cymbetáceæ in the tube of the calyx being constricted at the apex, in the one-celled fruit, and the pendulous seed; but differs in the greater number of petals, in the adnate anthers, in the albuminous seeds, and in the flat cotyledons. In the form of the anthers, and in the one-celled fruit, it differs from Melastomáceæ and Onagraéce. It agrees in some degree with Halorágææ in the fabric of the seed, but differs from it in habit, in the one-celled fruit, and single style. The properties are said by the Malays to be purgative and hydrogogue, and their roots aromatic.

Lin. syst. Icosándria, Monogyinia. Being no other genus the character is the same as that of the order.

1. A. decapétálum (Lam. dict. 1. p. 174.) flowers of 10 petals; branches glabrous, spinescent; leaves oblong-lanceolate. f. S. Native of Malabar, among rocks, where it is called Alang or Angolam by the natives. Rheed. mal. 4. t. 17. Grévia salvifolía, Lin. fil. suppl. 409. ex Vahl, symb. 1. p. 61. Berry or drupe rather tomentose, 2-3-seeded. Stamens 25, ex Vahl. The petals are either 10 or 12, and the stamens are double that number. Flowers white, with a grateful scent, solitary or 2-3-together in the axils of the leaves. The pulp of the fruit has a grateful sweet taste.

Ten-petalled Alangium. Ch. 1779. Chit. 30 ft.

2. A. hexapétálum (Lam. 1. c.) flowers of 6-7 petals; branches glabrous, hardly spinescent; leaves ovate-lanceolate, acuminate. f. S. Native of Malabar, among rocks, where it is called by the natives Kara-Angolam and Namidou. Stamens 10-12, but 26 according to Rheed. mal. 4. t. 26. but in the specimen examined by De Candolle, the petals were 7, and the stamens 28, therefore the stamens are three times the number of the petals. Leaves velvety beneath, and on the petals. Berry or drupe with a purple tomentose coriaceous rind, and red juicy clammy pulp, which has a rather acid taste; the nut one-seeded.

Six-petalled Alangium. Ch. 1823. Tree 30 ft.

3. A. tomentósæm (Lam. dict. 1. c.) flowers unknown; branches unarmed, velvety when young, as well as the petals and nerves of leaves; leaves oblong, bluntly acuminate, reticulated with little veins beneath. f. S. Native of the East Indies. Berry or drupe pubescent, with a woody coriaceous lîvî-purplé rind.

Tomentose Alangium. Ch. 20 ft. Cult. The species of Alangium thrive well in a mixture of loam and peat, or any light rich soil; and cuttings root readily if planted in a pot of sand, with a hand-glass placed over them, in heat.

Tube of calyx turbinate, adhering to the ovarium; limb 4-10-parted. Petals (f. 114. d.) alternating with the lobes of the calyx, and therefore equal to them in number, convolutely imbricate in activation. Stamens 20-40, inserted into the throat of the calyx in 1 or 2 series. Styles sometimes nearly distinct and at others more or less joined together in one; stigmas many. Capsule half adhering to the calyx, 4 (f. 114. b.) 10-celled, many-seeded. Seeds scrobiculate, subulate, smooth, heaped together at the angles of the cells on the angular placenta, covered by loose, membranous aril. Albumen fleshy. Embryo inverted, almost the length of the albumen (f. 114. c.), with ovate, obtuse, flatish cotyledons, and a nearly terete radicle, which is longer than the cotyledons.—This order consists of hardy ornamental shrubs. Leaves opposite, dotless, nerved, toothed, or nearly entire, exstipulate. Peduncles opposite, axillary, or terminal, trichotomously cynose, or somewhat panicked. Flowers white, in most cases fragrant. Philadelphææ is more closely allied to Saxifragææ than to Myrtáceæ; from the former, however, it differs widely in habit, but in the fructification differing chiefly in the numerous cells of the fruit, and in the indefinite stamens. From Myrtáceæ it differs in the arillate albuminous seeds, in the styles being more or less distinct, and in the toothed, dotless leaves. De Candolle points out an approach to Hydrângææ, and that it is a link connecting it with Viburnum, agreeing almost equally with Philadelphææ and Viburnææ in habit and fructification.

2 Decumaria. Limb of calyx 7-10-toothed. Petals 7-10. Stamens three the number of the petals. Style 1, crowned by 7-10 stigmas. Capsule 7-10-celled.

I. PHILADELPHUS (the Philadelphus of Aristotle is a tree not now known; it is said to be from Ptolemy Philadelpus, King of Egypt). Lin. gen. no. 614. Gærtn. fruct. 1. p. 173. t. 35. D. C. prod. 3. p. 205. Syringa, Tourn. inst. t. 389, but not of Lin.

Lin. syst. Icosandra, Tetra-Pentagynia. Tube of calyx obovate-turbinate; limb 4-5-parted. Petals 4 (f. 114. d.) - 5. Stamens 20-40, free, shorter than the petals. Styles 4-5, sometimes connected, and sometimes more or less distinct. Stigmas 4-5, oblong or linear, usually distinct, rarely joined. Capsule 4 (f. 114. b.) - 5-celled, many-seeded. Seeds scrobiliform, enclosed in a membranous arillus (f. 114. c.), which is fringed at one end (f. 114. d.).—Shrubs, with pedicellate, white, usually sweet-scented flowers, disposed in corymbose cymes, or sometimes panicled, rarely axillary and bracteate.

§ 1. Stems stiff, straight. Flowers in racemes.

1 P. coronarius (Lin. spec. 671.) leaves ovate, acuminate, serrately denticulated, triple-nerved, smoothish, but hairy at the veins beneath; flowers racemose; lobes of calyx acuminate; styles almost distinct from the stamens, not. H. Native of the south of Europe. Curt. bot. mag. 391. The leaves have the taste of cucumbers. The flowers are white, and have a strong scent, which, at a distance, resembles that of orange flowers, but near it is too powerful for most persons. The primary flowers are 5-cleft, but the rest are 4-cleft.

Var. a, vulgaris (D. C. prod. 3. p. 205.) shrub strong; leaves oval-oblong, large, rather distant. H. Schkuhr. handb. t. 121. Lam. ill. t. 420. Var. ß, nanus (Mill. dict. no. 2.) shrub 1-2 feet high; leaves and branchlets crowded; flower-bearing branches incurved. H. Native country unknown. This variety is sometimes to be found in gardens with double flowers.

Var. ß, florae-plenus; flowers double.

Var. ß, varie-gatus; leaves edged with white or yellow.

Garland or Common Syringa or Mock-orange. Fl. May, June. Clt. 1596. Shrub 2 to 10 feet.

2 P. Zeyheri (Schrad. diss. with a figure, ex D. C. prod. 3. p. 205.) leaves ovate, acuminate, serrately denticate, rounded at the base, triple-nerved, hairy at the veins beneath; flowers somewhat racemose; lobes of calyx long-acuminate; style profoundly 4-cleft. H. Native of North America. This species is of more humble habit than P. coronarius, and differs chiefly from it in the leaves being rounded at the base, and in the flowers being fewer, larger, and scentless.

Zeyher's Syringa or Mock-orange. Fl. May, June. Clt. Shrub 3 to 4 feet.

3 P. floribundus (Schrad. diss. with a figure, ex D. C. l. c.) leaves ovate-oval, long-acuminate, serrate-toothed, triple-nerved, clothed with hairy pubescence beneath; flowers somewhat racemose; lobes of calyx ending in a long acumens each; style 4-cleft at the apex. H. Native of North America. Flowers white, 5-7, showy, sweet-scented.

Buddle-flowered Syringa or Mock-orange. Fl. May, June. Clt. Shrub 4 to 8 feet.

4 P. verrucosus (Schrad. diss. with a figure, ex D. C. l. c.) leaves elliptic-ovate, acuminate, dentillated, clothed with hairy pubescence beneath; flowers racemose; lobes of calyx acuminate; style 4-cleft at the apex. H. Native of North America. Philephilus grandiflorus, Lindbl. bot. 370. Pursh, fl. sept. am., but not of Wild. The leaves on the ribs and primary veins beneath, as well as the peduncles, pedicels, and calyces, are beset with hair-bearing warts. Flowers large, white, scentless.

Warted Syringa or Mock-orange. Fl. May, June. Clt. Shrub 4 to 6 feet.

5 P. latifolius (Schrad. diss. ex D. C. prod. 3. p. 506.) leaves broad-ovate, acuminate, toothed, somewhat quintuple-nerved, clothed with hairy pubescence beneath; flowers racemose; lobes of calyx acuminate; style 4-cleft at the apex. H. Native of North America. P. latifolius, Hortul. P. pubescentes, Cels. hort. Lois. herb. amat. t. 208. This species is known by its white bark, and by the leaves being broad ovate, beset with hairs, which are naked at the base, not with warts, as well as the young branches.

Broad-leaved Syringa or Mock-orange. Fl. May, June. Clt. Shrub 4 to 6 feet.

§ 2. Stems more slender, twiggy, loose. Flowers solitary or 2 together.

7 P. grandiflorus (Willd. enum. 1. p. 511.) leaves ovate, long-acuminate, denticate, triple-nerved, hairy at the veins beneath, and with fascicles of pli in the axils of the veins; flowers solitary, or by threes; lobes of calyx long-acuminate; styles joined in one, longer than the stamens, crowned by 4 linear stigmas. H. Native of North America. Guimp. abb. holz. t. 44. Schrad. diss. with a figure. P. inodorus, Hortul. Branches covered with a castaneous blood-coloured epidermis. Flowers large, scentless.

Great-flowered Syringa or Mock-orange. Fl. June, July. Clt. 1811. Shrub 6 to 8 feet.

8 P. speciosus (Schrad. diss. with a figure, ex D. C. l. c.) leaves ovate, rarely oval-ovate, long-acuminate, sharply serrate-toothed, clothed with hairy pubescence beneath; flowers solitary, or by threes; lobes of calyx with very long acumens; style deeply 4-cleft, exceeding the stamens. H. Native of North America. P. grandiflorus, German gardeners. P. grandiflorus ß, laxus of other gardeners. Tube of calyx nearly terete. Capsule 8-valved, ex Schrad., but more likely 4-valved, with the valves becoming 2-parted at maturity. Flowers large, white, scentless?

9 P. laxus (Schrad. diss. with a figure, ex D. C. l. c.) leaves oval-ovate, long-acuminate, toothed, clothed with hairy pu-

Baccense beneath; flowers solitary and by threes; lobes of calyx ending each in a very long acumens; style 4-cleft; stigmas about equal in length to the stamens.  Ph. H. Native of North America. P. laxus and P. humilis, Hortul. Humbler than the preceding plant.

Loose Syringa or Mock-orange. Fl. June. Ct. 7. Shrub 4 to 6 ft.
10 P. niscas (Nutt. gen. amer. t. p. 301.) leaves oblong-ovate, acute, toothed, 5-nerved, hairy on both surfaces, white beneath; flowers solitary and by threes; style united to the apex; stigmas divided. Ph. H. Native of North America, in Tennessee, at French River; frequent among rocks. Flowers white, scentless?

Hair Syringa or Mock Orange. Shrub 2 to 3 ft.
11 P. Lewisii (Purnh, fl. amer. sept. 1. p. 329.) leaves ovate, acute, almost entire, with ciliated margins; style length of the stamens, trifid at the apex. Ph. H. Native of North America, at Clark's river, in watery places. Flowers smaller than those of the following species.

Lewis's Syringa or Mock-orange. Fl. June. Ct. 7. Shrub 6 to 8 ft.
12 P. inc orus (Lin. spec. p. 671.) leaves broad-ovate, acuminate, quite entire, triple-nerved, or nearly feather-nerved; flowers solitary, and by threes; style cleft at the apex into 4 oblong stigmas. Ph. S. Native of South Carolina, very rare, on the banks of rivers. —Purnsh, fl. amer. sept. 1. p. 329. Sims, bot. mag. t. 1478. Syringa incorsa, Moench. —Catesb. car. 2. t. 84. Flowers white, scentless, large.

Cult. All the species of Philadelphus or Syringa are very desirable plants for shrubberies, the flowers being showy, and of many of the species sweet-scented. They grow in any common soil; and are readily increased by laying down the branches.

II. DECUAMRA. (from écuca, decum, a tenth; in reference to the tenfold structure of some of the flowers.) Lin. gen. no. 597. Lam. ill. t. 403. D. C. prod. 3. p. 206. —Forsythia, Wult. but not of Vahl.

Lin. syst. Icosandroid, Monogynia. Tube of calyx campanulate; limb 7-10-toothed. Petals oblong, equal in number to the teeth of the calyx, and alternating with them. Stamens twice the number of the petals, disposed in one series, 2 in front of each petal, and one between each. Style one, very thick, expanded at the apex into a disk, bearing 7-10 radiating stigmas. Capsule ovoid, conuate with the calyx to the above the middle, which is 7-10-nerved, and toothless, crowned by the style and stigmas, valveless, 7-10-celled, opening irregularly near the prominent nerves of the calyx. Seeds numerous, oblong, included in a membranous aril, fixed obliquely by their centre. Sarmentose shrubs. Leaves opposite, glabrous, entire or toothed at the apex, deciduous. Flowers white, sweet-scented, disposed in terminal corymbs, sometimes they are to be found obscure in gardens. Leaf-buds beset with short rufous pili.

Cult. Decumaria is a very proper shrub for training against a wall or on trellis work, to form bowers, for which it is well adapted from its sweet-scented flowers. It thrives well in any common soil, and is easily increased by laying down the branches or by cuttings.

Lin. syst. Deoandria, Trigynia. Tube of calyx campanulate, tomentose; limb 5-6-cleft. Petals 5-6, oblong and 10; filaments tricuspidate. Styles 3-4, longer than the corolla; stigmas simple, club-shaped. Capsule globular, truncate, perforated, somewhat 3-cornered, scabrous, awned from the permanent bases of the styles, 3-4-valved, 3-4-celled, small, opening at the base. Seeds several in each cell. —Much branched shrubs, with the branches purplish and villous. Leaves opposite, petiolate, ovate, acuminate, serrated, wrinkled, and veined, scabrous from stellate fascicles of down. Flowers in compound panicles. Peduncles and pedicels tomentose and scabrous.

1 D. saccara (Lin. syst. p. 435. Thunb. jap. 185. t. 24.) leaves ovate, acuminate, serrated, scabrous from stellate down; flowers in compound panicles; peduncles and pedicels scabrous; calyx lobes short and blunting. Ph. H. Native of Japan, where the leaves are used by joiners in smoothing and polishing.

Scabrous Deutzia. Fl. May, June. Shrub 4 to 6 ft.

2 D. staminea (R. Br. mss. in Wall. pl. rar. asiat. 2. p. 82. t. 191.) young branches clothed with stellate tomentum, old ones glabrous; leaves quite entire, scabrous, lanceolate, acuminate, cuspidately serrated, white from tomentum beneath; cymes triolomorphic; peduncles 3-flowered; pedicels and calyxes biseret with stellate tomentum outside. Ph. H. Native of Nipal, on the high mountains near the Great Valley. Philadelphus or Leptosperrum staminatum, Wall. Flowers white, sweet-scented. Styles 4-6, length of the stamens; teeth of filaments shorter than the anthers; teeth of calyx lanceolate, acute.

Long-tomented Deutzia. Shrub 3 to 4 ft.

3 D. corymbosa (R. Br. in Wall. cat. 3652.) glabrous; leaves ovate, acuminate, cuspidately serrated; panicles corymbose, tricholomous; pedicle and outside of calyx dotted; teeth of calyx short and rounded; teeth of filaments shorter than the anthers. Ph. H. Native of Kamaon, Philadelphus corymbosus, Wall. Flowers white.

Corymbose-flowered Deutzia. Shrub 3 to 4 ft.

4 D. brevistyla (Wall. cat. 3650.) leaves ovate, acuminate, cuspidately serrated, clothed with hoary tomentum beneath, as well as the peduncles and calyces; pedicels axillary; lobes of calyx subulate; petals narrow; cusps of filaments longer than the anthers. Ph. H. Native of Kamaon. Leptosperrum scabrum, Wall. Flowers white. Fruit small.

Brown's Deutzia. Shrub 4 to 5 ft.

Cult. Any common soil will suit these shrubs, and they may easily be increased by laying down the branches or by cuttings.

Calyx superior, 4-5-cleft (f. 115. a. f. 117. b.), rarely 6-cleft, sometimes falling off like the cap, in consequence of the cohesion
at the apex; tube adnate to the ovary (f. 115. a, f. 123. a.). Petals equal in number to the lobes of the calyx, inserted in the calyx, rarely wanting; but when present with a quinquinal activation (f. 122. b.). Stamens inserted along with the petals (f. 115. e, f. 123. b.), and are either twice their number or indefinite (f. 119. e, f. 123. b.), usually disposed in many series; filaments distinct (f. 123. b.), or connected into several parcels (f. 117. c. e), curved inwards before flowering; anthers ovate, 2-celled, small, bursting lengthwise (f. 120. c.). Ovarium inferior, 2-4-5 or 6-celled; style simple (f. 119. c.). Stigma simple. Fruit either dry (f. 119. d.) or fleshy (f. 121. c.), dehiscent or indehiscent. Seeds usually indefinite, variable in form. Embryo exalbuminous, straight or curved, with its cotyledons and radicle distinguishable, or conferruminated into a solid mass.—Trees or shrubs. Leaves usually opposite (rarely alternate, as in Barringtoni), entire, full of transparent dots, feather-nerved, the nerves usually running into each other towards the margin, and forming a vein running parallel with the margin. Inflorescence variable, sometimes on 1-flowered axillary pedicels, sometimes on axillary 2-flowered trichotomous cymose peduncles, or the peduncles are furnished with many opposite flowers, and terminated by one flower; sometimes the flowers are sessile and spicate; always with 2 opposite bracts under each flower. Flowers white, red, occasionally yellow, but never blue.

Myrtaceae is one of the most natural among the tribes of plants, and the most easily recognised. Its opposite exstipulate clothed entire leaves, with a marginal vein, are a certain indication of it, with the exception of a few plants, which probably do not belong to the order, although at present placed in it. It is closely allied to Rosaceae, Lythraceae, Onagraceae, Combretaceae, and Melastomaceae, but cannot well be confounded with any other tribe. It is distinguished from Lythraceae by the calyx being adnate to the ovary, from Combretaceae in the many-celled ovary, in the erect or horizontal seeds, not pedunculous, and in the cotyledons not being convolute; from Melastomaceae in the filaments not being bent abruptly, nor revolved in vacuities below the recesses of the calyx, as in that order, and in the form of the stamens; from Onagraceae in the stamens being usually indefinite. The order offers a curious instance of the facility with which the calyx and corolla can take upon themselves the same functions of transformation. In Eucalyptus, as is well known, the sepals are consolidated into a cup-like lid, called the operculum. In Endémia, a nearly related genus, the calyx remains in its normal state, while the petals are consolidated into the operculum. The pellucid dottings of the leaves, and other parts, indicate the presence of a fragrant aromatic or pungent volatile oil, which gives the principal quality to the products of the order. To this are to be attributed the grateful perfume of the Guayra fruit, the powerful scent of the flower-buds of Caryophyllus aromáticae, called in England cloves, and the balsamic odour of the eastern fruits called the Jamsurade and the Rose-apple. The fruit of various Eugenias are found by travellers in the forests of Brazil to bear very agreeable fruit. A fruit of Brazil, called Hopoticabieras, brought from the forests to the towns of St. Paul and Tejuclo, belongs to this order; it is said to be delicious. (St. Hl. pl. usual. p. 29.) The young flower-buds of Calyptranthes aromáticae have the flavour and quality of cloves, for which they might be advantageously substituted, according to M. Auguste St. Hilaire, pl. usual. no. 14. The volatile oil of cajeputi, or cajeput oil, is distilled from the leaves of Melaleuca leucadendron and M. cajeputi, and is well known as a powerful sudorific; and is a useful external application in chronic rheumatism. (Ainslie, 1. p. 260.) It is considered carminative, cephalic, and emmenagogue, and is no doubt a highly diffusible stimulant, antispasmodic and diaphoretic, and on that account is used in the cure of cholera. It has also the power of dissolving caoutchouc. (Ibid.) The root of Stravedium racemösum has a slightly bitter, but not unpleasant taste. It is considered the Hindoo doctors valuable on account of its aperient, deobstruent, and cooling properties; the bark is supposed to possess properties similar to Cinchona. (Ibid. 2. p. 65.) A kind of gum is yielded by Eucalyptus resinteca, which is occasionally sold in the medicine bazaars of India. (Ibid. 1. p. 185.) Other species of Eucalyptus yield a large quantity of tannin, which has been even extracted from the trees of New Holland, and sent to the English market. The leaves of Olaphyria nitida, called by the Malays the tree of long life, probably from the other trees of the forest having ceased to exist, afford at Bencoolen a substitute for tea, and it is known by the natives by the name of tea plant. (Lin. trans. 14. p. 129.)

Synopsis of the genera.

Tribe I.

Chameliauc'æ. Lobes of calyze 5 (f. 115. b). Petals 5. Stamens disposed in one series, fertile and sterile mixed (f. 115. e. c.). Fruit dry, 1-celled. Ovaria numerous, erect from the base, fixed to the centre or to the somewhat exserted central placenta.—Heath-like shrubs, all natives of New Holland. Leaves opposite, dotted. Flowers small, on short pedicels. Bracteæ 2 under each flower, free or joined.

1. Calýnthix. Calyx drawn out into a cylindrical tube (f. 115. a.); lobes ending in a long bristle each (f. 115. g.). Stamens 10-30, free. Fruit dry, indehiscent, 1-celled.

3. Vertico'dia. Flowers before expansion girded by 2 free or concrete bracteæ; lobes of calyx palmately parted into 5-7 lobules. Stamens 20, of which 10 are sterile and ligulate. Stigma feathered. Fruit 1-seeded, 1-celled when mature.

4. Chamelauc'cum. Flowers girded by 2 concrete bracteæ, which terminate each in a dorsal mucrone; lobes of calyx unipartitæ, petaloid. Stamens 20, 10 of which are sterile and ligulate. Stigma capitate. Ovarium 1-celled, 5-6-ovulatæ.

5. Genet'yllis. Flowers girded by 2 distinct bracteæ; lobes of calyx short, obtuse, entire. Stamens 20, many of which are sterile, all filiform. Stigma bearded. Ovarium 1-celled, 5-6-ovulatæ.

6. Pile'a'nhus. Flowers inclosed in a 1-leaved calypteriform involucrium before expansion; limb of calyx 10-partitæ; lobes rounded. Stamens 20, all fertile, some simple, others bifurcate. Ovarium 1-celled, 5-7-ovulatæ. Stigma obtuse.
Tribe II.

**Leptospermeae.** Calyx 4-6-lobed (f. 116. b. f. 117. b.). Petals 4 (f. 116. b.) -6. Stamens free (f. 119. e.) or polyadelphous (f. 117. e.). Fruit dry, many-celled. Seeds exarillate and exalbuminous.—Shrubs or trees, natives of New Holland. Leaves opposite or alternate, usually full of pellucid dots. Inflorescence many-flowered. Flowers sessile, in pedicellate flowers (f. 118.); sometimes syvate and centripetal, with sessile flowers (f. 116. f. 117.).

Subtribe I. Melaleucceae. Stamens polyadelphous (f. 116. e. f. 117. c.).

9 Beaufórtia. Limb of calyx 5-parted; lobes acute. Bundles of stamens opposite the petals. Capsule adhering to the tube of the calyx, 3-celled; cells 1-seeded. Flowers sessile.

11 Melaleu'ca. Limb of calyx 5-parted (f. 117. b.). Bundles of stamens elongated, opposite the petals (f. 117. c.). Capsule covered by the calyx (f. 117. a.), and adnate to the base of the branches, 3-celled, many-seeded. Flowers sessile.

12 Lama'rechea. Limb of calyx 5-parted. Petals campanulately connate. Stamens monadelphous at the base, but dividing into 5 polyandrous parts at the apex. Capsule covered by the chameraceal calyx, 3-celled, opening by 3 valves at the apex, globose, woody, many-seeded. Flowers axillary, solitary, sessile.

13 Eude'smia. Limb of calyx 4-toothed. Petals joined into a deciduous operculum. Bundles of stamens 4, alternating with the teeth of the calyx. Capsule 4-celled, 4-valved. Flowers pedunculate.

Subtribe II. Eucalyptodeae. Stamens free. (f. 119. e.)

14 Eucalyptus. Limb of calyx lid-formed, falling off in one piece (f. 118. b.). Petals none. Stamens numerous. Capsule 4-celled (f. 118. c.), or from abortion only 3-celled, many-seeded.

15 Angórhora. Limb of calyx 5-toothed. Stamens numerous. Capsule covered by the calyx, 3-celled, 3-valved; cells 1 or few-seeded. Flowers corystose.

16 Callistemon. Limb of calyx 5-parted; lobes obtuse. Stamens numerous (f. 119. e.). Capsule 3-celled (f. 119. b.), many-seeded, incrusted by the calyx. Flowers sessile.

17 Metroside'ros. Limb of calyx 5-6-cleft (f. 120. a.). Stamens 20-30, very long. Capsule 2-3-celled; cells many-seeded. Flowers pedicellate.

21 Be'e'kea. Limb of calyx 4-cleft. Stamens 5-10, shorter than the petals. Capsule 2-5-celled, many-seeded, inclosed in the calyx. Flowers pedicellate.

Tribe III.

**Myrtaceae.** Calyx 4-5-parted (f. 121. b. f. 122. d. a.). Petals 4-5. Stamens free (f. 123. b.). Fruit fleshy, baccate, many-celled (f. 121. c.).—Trees or shrubs. Leaves opposite, full of pellucid dots, or ocape, quite entire. Peduncles axillary, sometimes 1-flowered, sometimes in trichotomous cyrnes, and sometimes branched and approximating into a terminal panicle.

22 Sonneratia. Calyx adhering to the ovariurn at the base, 4-6-cleft. Stamens numerous. Berry adnate to the calyx at the base, the rest girdled by it, 10-15-celled. Seeds curved, imbedded in fleshy pulp. Flowers large, terminal, solitary. Leaves dotted.

23 Né'ritus. Calyx 4-5-toothed. Stamens numerous. Ovarium 4-10-celled. Berry crowned by the calyx, few or many-seeded. Flowers pedicellate. Leaves dotted.

25 Ps'am'mum. Tube of calyx rather contracted at the apex, limb at first undivided, but at length cleft into 1-5 parts (f. 121. b.). Stamens numerous. Ovarium 5-20-celled. Berry many-seeded (f. 121. c.), crowned by the lobes of the calyx. Seeds imbedded in pulp. Leaves dotted.

26 Jossi'nia. Limb 4-parted even to the base; lobes open in resivation. Stamens numerous. Fruit fleshy, crowned by the calyceine lobes, many-seeded. Peduncles 1-flowered.

30 Syzy'gium. Limb of calyx almost entire, or more or less lobed. Petals 4-5, concrete, falling off in the shape of a calyptra. Stamens numerous. Ovarium 2-celled; cells few-ovulate. Berry 1-celled, 1 or few-seeded. Seeds globose. Peduncles axillary and terminal, in cyrnerous corynbs.

31 Caryophyll'lus. Limb of calyx 4-parted (f. 123. d.).
MYRTACEÆ. I. CALYTHRIX.

Petals 4, cohering at the apex, as in Syzygium. Stamens free (f. 125. b.), disposed in 4 bundles, inserted near the teeth of the calyx. Ovarium 2-celled (f. 125. a.); cells many-ovulate. Berry 1-2-celled, 1-2-seeded from abortion. Cymes terminal, or in the forks of the branches. Leaves dotted.

33 Euge'nia. Limb of calyx 4-parted even to the ovarium. Stamens numerous. Ovarium 2-3-celled; cells many-ovulate. Berry nearly globose, crowned by the calyx; when mature 1, rarely 2-celled, 1-2-seeded. Seeds large, roundish.

Tribe IV.

Barringtoni'e. Calyx 4-6-toothed. Petals 4-6. Stamens numerous, disposed in many series; filaments monadelphous a short way at the base. Fruit baccate or dry, many-celled. Cotyledons large, fleshy.—Trees, with dotless, alternate, or nearly opposite leaves, or crowded in whorls, quite entire or serrated. Flowers in racemes or panicles.

36 Stra'veniun. Limb of calyx 4-parted. Ovarium semi-bilocular; cells 2-ovulate. The rest as in Barrington'mia.

37 Gusta'via. Limb of calyx entire, or 4-6-8-lobed (f. 126. b.). Petals 4-6-8. Stamens numerous. Ovarium 4-6-celled; cells many-ovulate. Capsule 3-6-celled; cells few-seeded.—Trees, with dotless leaves.

† Genera belonging to Myrtaceae, and probably for the most part to tribe Myrtae, from the fruit being baccate; but from the seeds being unknown it is doubtful what place they should occupy in the order.

39 Pelalot'oma. Limb of calyx 8-cleft; the segments acute. Petals 6-8, unguiculate, with the limbs cut. Stamens 16, inserted in the fleshy crenated disk. Stigma 4-5-cleft. Berry round, crowned by the limb of the calyx, 1-seeded.

40 Fucti'dia. Limb of calyx 4-parted; lobes valvate in scission. Petals wanting. Stamens numerous, in many series, free. Stigma 4-cleft. Berry dry, indesincent, bluntly tetragonal, 4-celled; cells 1-2-seeded. Leaves alternate, dotless.

44 Crossostylis. Calyx 4-angled, adnate to the ovarium at the base, permanent, 4-cleft beyond the middle. Petals 4, unguiculate. Stamens about 20; filaments connate into a ring at the base, intermixed with sterile threads. Stigma 4-lobed; lobes trillid at the apex. Berry striated, 1-celled, many-seeded.

Tribe I.

Chamae'lau'cium (plants agreeing with the genus Chamaelaucium in important characters). D. C. dict. class. vol. 11. and not. 1826. prod. 3. p. 208. Lobes of calyx 5 (f. 115. g.). Petals 5 (f. 115. b.). Stamens disposed in one series, free (f. 115. e.), or somewhat polyadelphous, with some sterile ones mixed among the fertile. Fruit dry, 1-celled. Ovula numerous, erect from the base, fixed to the centre, or to the somewhat exserted central placenta.—Heath-like shrubs, all natives of New Holland. Leaves opposite, full of dots. Flowers small, on short pedicels. Bracteoles 2 under each flower; they are either free or joined together at the base, sometimes in the form of an operculum.

1. Calyth'rix (from kalys, kalix, a calyx, and Spa thiz, a hair; in reference to the lobes of the calyx, which end in a long hair each). Labill. nov. holl. 2. p. 8. t. 146. R. Br. in bot. reg. no. 409. D. C. prod. 3. p. 208.

Lin. syst. Deca-icosandra, Monogynia. Tube of calyx adhering to the ovary at the base, but drawn out at the apex into a long slender cylindrical tube; limb 5-parted (f. 115. g.), permanent, lobes ovate at the base, but each ending in a bristle at the apex (f. 115. g.), which is longer than the corolla. Petals 5 (f. 115. b.), deciduous. Stamens 10-30, free (f. 115. e.); anthers roundish. Style filiform, length of the stamens. Fruit dry, indesincent, 1-celled; when young baccate, but when mature 1-seeded.—Australian heath-like shrubs. Leaves scattered, crowded, terete, and rather angular, usually on very short pedicels, which are furnished with 2 small stiff filiform stipulas. Flowers axillary, solitary, almost sessile, propped by 2 membranous keeled bracteas, which are connate at the base. Petals purple or white, but yellowish when dried.

1 C. glabra (R. Br. l. c.) icosandrous; leaves petiolate, stipulate, glabrous in the adult state, as well as the bracteas. 2. G. Native of New Holland, near Port Jackson. Lodd. bot. cab. t. 556. Leaves when fresh terete, but when dry triangular. Petals pale reddish.

Pubescent Calythrix. Shrub 2 to 3 ft. 5 i. 2
MYRTACEÆ. I. CALYTHRIX. II. DARWINIA. III. VERTICORDIA. IV. CHAMELÆCUM. V. GENETYLLIS, &C.

3 C. tetrapera (Labill. l. c.) icosandrous; leaves petiolate, stipulate, glabrous in the adult state, as well as the bracteal branchlets villous. G. Native of New Holland, in Van Lewin’s Land. Petals yellowish according to the dried specimen. (f. 115.)

Four-winged Calythrix. Shrub 2 to 3 ft.

4 C. Scabra (D. C. prod. 3. p. 208.) icosandrous; leaves petiolate, with 2 very short stipulas, scabrous in the adult state, as well as the bracteae; branchlets villous. G. Native of New Holland, on the eastern coast. C. glabra, Sieb. fl. nov. hol. exsic. no. 285. but not of R. Br.

Scabrous Calythrix. Shrub 2 to 3 ft.

5 C. ericoides (Cunning. in Fields’ new south wales, p. 350.) icosandrous; leaves scattered, petiolate, stipulaceous, glabrous; stipulas deciduous; bractees one-half shorter than the tube of the calyx. G. Native of New Holland, in pine ridges, at Bathurst.

Leath-like Calythrix. Clt. 1824. Shrub 4 to 6 ft.

Cult. The species grow well in a mixture of loam, peat, and sand; and young cuttings strike root readily in sand under a hand-glass. All the species are singular.

Lin. syst. Deca-Icosändigia, Monogynia. Tube of calyx adhering to the ovary from the middle downwards, the other half membranous and deciduous, with the throat dilated; limb 5-cleft; lobes roundish-cordate, concave, full of pellucid dots, imbricate in estivation. Petals wanting. Stamens indefinite, from 10-15, inserted in the limb of the calyx, usually approximating by threes; filaments very short, flat, glabrous; anthers inserted by their bases. Ovarium 1-celled, 1-ovulate; ovulum erect. Style tapering to the top, and bearded at the apex; stigma a pruinose dot.—Seed pentagonal, scrobiculate on the outside.—Australian decumbent leafy shrubs. Leaves scattered, narrow, full of pellucid dots, articulated to the branches. Flowers interminal fascicles, red or white, interspersed with chaffy leaves or bracteae.

1 D. fasciculans (Rudge, in Lin. trans. 11. p. 299. t. 22.) leaves acerate; receptacle chaffy; style thrice the length of the flower. G. Native of New Holland. Calyx red.

2 D. taxifolia (Cunning. in Fields’ new south wales, p. 352.) leaves acinaciform; style shorter than the flower. G. Native of New Holland. Calyx white.

Cult. The species of Darwinia are singular plants; their culture and propagation are the same as that recommended for Calythrix.

III. VERTICORDIA (meaning unknown to us). D. C. dict. class. vol. 2. and not. 1826. prod. 3. p. 208.—Chamelæcum species of Desf. in ann. mus. 5. p. 29. and p. 271.

Lin. syst. Icosändigia, Monogynia. Flower girdled by 2 free or concrete involucrum-formed bractees before evolution.

Lobes of calyx 5, each palmately parted into 5-7 lobules. Petals 5. Stamens 20, of which 10 are sterile and ligulate, the other 10 fertile and equal among themselves. Style filiform, exserted. Stigma bearded. Ovarium 1-celled, inclining 5-6-ovula, which are erect and fixed to the centre. Fruit 1-seeded. Seed globose.—Australian shrubs, with the habit of Pileanthus. Leaves opposite, linear, somewhat triquetrous. Flowers on longish pedicles, rising from the axils of the upper leaves, disposed in a terminal corymb.

1 V. Fontainesh (D. C. prod. 3. p. 209.) calyx lobes linear, ciliated; bracteae on one side, and separating lengthwise on the other; leaves acutish. G. Native of New Holland, at King George’s Sound. Chamælaicum plumbsum, Desf. in mem. mus. 5. p. 42. t. 4.

Desfontaine’s Verticordia. Shrub 1 to 2 ft.

2 V. Brownii (D. C. l. c.) calyx lobes linear-subulate, bearded, and ending each in an awn; bractees distinct; leaves obtuse, adpressed. G. Native of New Holland. Chamælaicum Brownii, Desf. in mem. mus. 5. p. 272. t. 19.

Brown’s Verticordia. Shrub 1 to 2 ft.

Cult. For culture and propagation see Calythrix.

IV. CHAMELÆCUM (we suppose this name to be from χαμηλαευς, an humble poplar; but the application is unknown to us). D. C. prod. 3. p. 209.—Chamelæcum, Desf. in mem. mus. 5. p. 39.

Lin. syst. Icosändigia, Monogynia. Flower girdled by 2 concave bractees before evolution, each terminating in a dorsal mucrone, afterwards separating transversely. Lobes of calyx 5, undivided, petaloid. Petals 5. Stamens 20, of which 10 are sterile and ligulate, and the other 10 fertile and alternately shorter. Style inclosed; stigma capitate. Ovarium 1-celled, inclining 5-9 erect ovula, which are inserted in the central placenta.—Australian shrub, with the habit of Pileanthus. Leaves opposite, crowded, linear, triquetrous. Flowers axillary, white, on short pedicels.

1 C. ciliatum (Desf. l. c. p. 40. t. 3. f. B.) G. Native of New Holland, at King George’s Sound. Tube of calyx striated, glabrous, with the lobes roundish and ciliated.

Ciliated-calyced Chamelæcum. Shrub 1 to 2 ft.

Cult. For culture and propagation see Calythrix. A singular shrub.

V. GENETYLLIS (meaning unknown to us). D. C. dict. class. vol. 2. and not. 1826. prod. 3. p. 209.

Lin. syst. Icosändigia, Monogynia. Bracteoles 2, distinct, girdling the flower; limb of calyx 5-cleft; lobes very short, obtuse, entire. Petals 5, ovate, acutish, permanent, rather scarious. Stamens 20, short; of these many are sterile and filiform, not strap-formed. Style filiform, exserted; stigma bearded. Ovarium 1-celled, bearing 5-6 seeds at the base.—Australian shrubs, with the habit of Pileanthus. Leaves crowded, linear-triquetrous, full of glandular dots, but the upper or floral ones are linear, flat, and rather membranous. Flowers bibracteolate, capitate, white, sessile in the axils of the bractees. The calyx is like that of Chamælaicum; the style is like that of Verticordia, but differs from both in the sterile stamens not being ligula-formed, but filiform.

Cult. For culture and propagation see Calythrix. p. 812.

VI. PILEANTHUS (from πιλεως, pilos, a cap, and ἄνθος, anthos, a flower; in reference to the flower, which is inclosed within a 1-leaved involucrum before expansion). Labill. nov.
MYRTACEE. VI. PILEANThUS. VII. ASTARTEA. VIII. TRISTANIA. IX. BEAUFORTIA. 819

Lin. syst. Icacinia, Monagynia. Flowers inclosed in a 1-leaved involucrum before evolution, which is closed on all sides, but at length is circumcised at the base, and falls off in one piece, leaving a campanulate base. Limb of calyx 10-parted; lobes roundish. Petals 5. Stamens 20, all fertile; filaments free, some simple and others bifurcate at the apex; the anthers are therefore of 2 approximate or of 2 separated cells. Ovarium 1-celled, 5-6-ovulate; the ovules erect, and fixed to the base of the fruit. Stigma obtuse. Mature fruit unknown.—An Australian shrub, with the leaves and branches opposite. Flowers axillary, nearly terminal, white, on short pedicels.

1 P. LIMA'CBS (Labill. l. c.). ½. G. Native of New Holland, in Van Lewin's Land. Desf. ann. mus. 5. t. 3. ½. A. Leaves terete, and rather clavate, crowded at the tops of the branches. Lobes of calyx white.

Lima'-like Pileanthus. Shrub 1 to 2 feet.
Cult. For culture and propagation see Calyxtrix, p. 812.

Tribe II.

LEPTOSPERMEÆ (plants agreeing with Leptospermum in important characters). D. C. dict. class. vol. ii. and not. 1826. prod. 3. p. 209. Lobes of calyx 4-5 (f. 116. b. f. 117. b). Petals 4-5. Stamens free (f. 119. c.) or polyadephous (f. 117. c). Fruit dry, many-celled. Seeds exarillate and exalbunminous.—Shrubs and trees, all natives of New Holland, with the exception of a few from the neighbouring regions. Leaves opposite or alternate, usually full of pellucid dots. Infloroscence variable:—sometimes cymose and centrifugal, with pedicellate flowers (f. 118.); sometimes spicate and centripetal, with sessile flowers (f. 116. f. 117.), which are as if they were somewhat immersed in the hollows in the branches; but are sometimes produced in leafy spikes at the tops of the branches.

Lin. syst. Polyadelphía, Polyandría. Tube of calyx hemispherical; limb 5-parted; lobes semi-orbicular. Petals 5. Bundles of stamens alternating with the petals, and shorter than them. Style short; stigma capitate. Capsule half adhering to the calyx, 3-celled, 3-valved, many-seeded.—An Australian shrub, with opposite, linear, fleshy leaves, which, when young, are disposed in axillary fascicles; and pedicellate, solitary, axillary flowers. Habit of Bot'ke'la, but differs from it in the stamens being polyadephous, and from Melaleuca in the bundles of the stamens being alternate with the petals, not opposite to them, and in the stamens being pedicellate, not adnate to the branches.

Fascicul'-leaved Astartea. Shrub 6 to 9 feet.
Cult. For culture and propagation see Calyxtrix, p. 812.

1 T. NirifóllIA (R. Br. l. c.) leaves opposite, lanceolate, glaucous beneath; bundles of stamens tridentate or pendant. ½. G. Native of New South Wales. B. C. pl. 3. Ree. gart. mag. 1. t. 17. Melaleuca nirifóllia, Sims, bot. mag. t. 1585. Melaleuca salicifóllia, Andr. bot. nom. rep. 485. In each branch of the coryph there are 3 pedicellate flowers, one of which is quadripetal, and the other 2 quinquetal. Petals and stamens yellow.

Laurel-like Tristania. Shrub 5 to 10 feet.

3 T. PersicifóllIA (Cunningh. in Field's new south wales, p. 250.) leaves opposite, lanceolate, attenuated, acute, smooth, glaucous beneath, with undulate crenated or quite entire margins; calyces segments ovate, acute. ½. G. Native of New Holland, in ravines in spring wood. Allied to T. nirifóllia.

Peach-leaved Tristania. Shrub 12 to 16 feet.

4 T. Confé'rA (R. Br. l. c.) leaves alternate, lanceolate-elliptic, acute, those at the tops of the branches crowded; segments of calyx acute, foliaceous. ½. G. Native of New South Wales. Leaves almost of Pittosporum.

5 T. Subval'ens (Smith, in Rees' cycl. vol. 36. no. 2.) leaves alternate, elliptic; calyx somewhat hemispherical, with a repand margin. ½. G. Native of New Holland, at Endeavour River. Melaleuca subval'ens, Gartn. fruct. 1. p. 173. t. 35. Smith, in Rees' cycl. 23. no. 4. Flowers yellow. Calyx villous.

Sweet-scented Tristania. Tree.

6 T. Al'bëns (Link et Ott. in hort. berol. ex D. C. prod. 3. p. 210.) leaves elliptic, ciliated, rather hairy on the nerves on both surfaces. ½. G. Native of New Holland?

Whitish Tristania. Tree.

7 T. Depress'ssa (Lodd. cat. ex Link. ann. 2. p. 273.). ½. G. Native of New Holland. This species is not described.

Cult. Tristanía is a genus of fine-leaved trees or shrubs. The species grow well in an equal mixture of peat, loam, and sand; and cuttings, not too ripe, strike root readily if planted in a pot of sand, and placed under a hand or bell-glass.

IX. BEAUFORTIA (so named in compliment to Mary Duchess of Beaufort, a botanical patroness). B. R. Br. in Ait. horta. kew. ed. 2. vol. 4. p. 418. D. C. prod. 3. p. 411.

Lin. syst. Polyadelphía Polyandría. Tube of calyx turbinate; limb 5-parted; lobes acute. Petals 5. Bundles of stamens 5, opposite the petals. Anthers inserted by the base, bifid at the apex; lobes deciduous. Style filiform. Capsule ciliate, incrusted to the tube of the calyx, 3-celled; cells 1-seeded.—Elegant Australian shrubs, with sessile, opposite, or scattered leaves, and scarlet flowers.

2 B. spa'rsa (R. Br. l. c.) leaves scattered, oval, many-nerved. \( \varphi \), G. Native along with the preceding species. Flowers red.

Scattered-leaved Beaufortia. Shrub 3 to 10 feet.

3 B. carinata (Cunningh. mss. ex Loud. Hort. brit. p. 319.) leaves opposite, decussate, many-nerved, keeled on the back, ovate or oval, glaucous. \( \varphi \), G. Native of New Holland. Flowers scarlet.

Keeled-leaved Beaufortia. Shrub 2 to 4 feet.

N.B. There are two other species, which were detected by Mr. Brown; but they still remain unpublished.

Cult. This is a splendid genus of plants, and therefore the species are desirable objects in every collection of greenhouse plants; they are also very suitable for conservatories, being free growers and abundant flowerers. Their culture and propagation is the same as that recommended for Tristandra, see p. 813.

X. CALOTHAMNUS (from καλός, kalos, beautiful, and θάμνος, thamnos, a shrub; in reference to the elegance of the shrubs, from their scarlet flowers and terete leaves). Labill. nov. holl. 2, p. 25. R. Br. in Ait. Hort. kev. 4. p. 417. —

Baudin, Leschen. imed.

Lin. syst. Polyadelpheia Polyandraia. Calyx permanent, 4-5-toothed (f. 116. b.), with a hemispherical tube. Petals 4-5 (f. 116. b.). Bundles of stamens equal in number to the petals (f. 116. c. a.), and opposite them. Anthers inserted by the base. Style filiform. Capsule corticate from the calyx, 3-celled, many-seeded. — Elegant Australian shrubs, with scattered, crowded, terete leaves, and axillary, solitary, scarlet flowers, which are sessile, and the fruit is therefore adnate to the branches.

* Flowers quadrijug.

1 C. sanguinea (Labill. l. c. t. 154.) 2 of the bundles of stamens bearing 12-16 anthers, and joined together on one side; the other two free, sterile, monandrous; adult leaves, as well as fruit glabrous. \( \varphi \), G. Native of New Holland, in Van Levin’s Land. Flowers scarlet.

 Bloody flowered Calothamnus. Shrub 2 to 6 feet.

2 C. quadrifida (R. Br. in Ait. Hort. kev. 4. p. 418.) bundles of stamens 4, distinct, equal, bearing 12-15 anthers each; adult leaves as well as flowers glabrous. \( \varphi \), G. Native of New Holland, on the south-west coast. Rebh. gard. mag. 1. t. 9. lower figure. Sims, bot. mag. 1506. Anthers inserted by the base. Flowers scarlet, somewhat secund.

* Flowers quintijug.

3 C. villosa (R. Br. l. c.) bundles of stamens equal, distinct, polyandrours; adult leaves as well as fruit villous. \( \varphi \), G. Native of New Holland, on the south-west coast. Lindl. bot. reg. t. 1099. Rebh. gard. mag. 1. t. 9. lower figure. Colla, hort. rupl. appl. 27. p. 328. t. 15. Flowers scarlet. (f. 116.)

4 C. gracilis (R. Br. l. c.) bundles of stamens equal, triandrous; leaves very long, and are as well as the exserted fruit, glabrous; stem branched.

G. Native of New Holland, on the south-west coast. Leaves stiff, acute, terete. Flowers scarlet.

5 C. clavatus (Cunningh. mss. ex Loud. Hort. brit. p. 319.) bundles of stamens equal, polyandrours; adult leaves as well as fruit downy. \( \varphi \), G. Native of New Holland. Leaves terete, clavate at the apex. Flowers scarlet.

Cult. The species of Calothamnus deserve a place in every collection of greenhouse plants, for the splendour of their blossoms. Their culture and propagation is the same as that recommended for Tristandra, see p. 813. The glass placed over the cuttings requires to be taken off and wiped occasionally, to prevent damp.

Lin. syst. Polyadelpheia Polyandraia. Tube of calyx somewhat hemispherical (f. 117. a.); limb 5-parted (f. 117. b.). Petals 5. Bundles of stamens 5 (f. 117. c. g.), elongated, opposite the petals. Style filiform (f. 117. c.); stigma obtuse. Anthers incumbent. Capsules connate, inclosed in the thickened tube of the calyx, and adnate to the branches by the base, 3-celled, many-seeded. Seeds angular.—Trees and shrubs, for the most part natives of New Holland, and a very few of the East Indies. Leaves alternate, or opposite, equal at the base. Flowers always sessile, or somewhat adnate to the branches, spicate or capitate, white, yellow, or purple.

* Leaves alternate.

1 M. leucodenron (Lin. mant. 105.) leaves alternate, long, lanceolate, acuminate, falcate, 3-5-nerved; flower-bearing branches pendulous; flowers in spikes, rather distant, and are as well as the rachis quite glabrous. \( \varphi \), S. Native of the East India Islands, where it is called Caju-puti by the natives.—A tree with a black trunk, white branches, and white flowers. Rumph. amb. 2. p. 72. t. 16. Myrtus leucodendron, Lin. fil. suppl. Melaleuca leucodendron lafioia, Lin. fil. suppl. p. 342. M. leucodendron, Hayne, arzn. gew. 10. t. 9. From the leaves of this tree is distilled the volatile, green, aromatic oil called Cajeput, from Caju-puti, a white tree, which is the Malay name, whence also Limneus gave it to the name of Leucodendron. The oil has the taste of peppermint, but stronger and colder, and a smell of turpentine, but it seldom comes to Europe unadulterated. It is a powerful sudorific, and an useful external application in chronic rheumatisms. Ainsle, 1. p. 260. It is considered carminative, cephalic, and emmenagogue, and is, no doubt, a highly diffusible stimulant, antispasmodic, and diaphoretic, and is much used in the cure of cholera morbus, from its antispasmodic powers. It has also the power of dissolving caoutchouc. A decoction of the leaves is much used in China as a tonic. The bark is very serviceable in caulking boats, covering houses, &c.

White-tree or Cajeput-tree. Clt. 1796. Tr. 15 to 20 ft.

2 M. siskorn (Smith, in Rees’ cyclo. vol. 23. no. 2.) leaves alternate, elliptic-lanceolate, acutish, rather falcate, 3-5-nerved; flowers rather distant, in spikes; rachis and calyxes villous. \( \varphi \), S. Native of Ambon, and other East India islands, where it is called in the Malay language Cajuputi and Caju-kide. Rumph. amb. 2. p. 74. t. 17. f. 1. and probably f. 2. M. Cajuputi, Roxb. Hort. Beng. p. 59. M. saligna, Gmel. syst. 793. is referrible to this species, according to the synonymes given to it. M. Cajuputi of gardeners is totally distinct from this.
species. The trunk is black, and the branches and flowers white, as in the last species. Cajeput oil is also distilled from the leaves of this tree; probably in greater quantity than from the last.

3 M. viridiflora (Garnt. fruct. 1. p. 178. t. 35.) leaves alternate, elliptic-lanceolate, equal-sided, 5-nerved, acute at both ends; flowers approximate in spikes; calyces, rachis, and branchlets pubescent; claws of the bundles of stamens shorter than the segments of the calyx, or obsolete. H. G. Native of New South Wales, and of New Caledonia. Smith, et R. Br. l. c. no. 2. M. lennocéphron angustifolia, Lin. fl. suppl. 3. p. 342. M. angustifolia, Garnt. Metrosideros quinquenervia, Cav. Icon. 4. t. 333. Metrosideros coriacea, Poir. suppl. 3. p. 685. but not of Salish. Metrosideros álida, Sieb. pl. exsic. nov. holl. no. 549. Flowers pale greenish yellow.

Greenish-flowered Melaleuca. Clt. 1777. Tr. 10 to 20 ft.

4 M. paludósa (Br. in Ait. hort. kew. 4. p. 410.) leaves alternate, linear-lanceolate, elongated, equal-sided, straight, 3-nerved; lateral nerves approaching the margin, which is scabrous; rachis of the spike, which is cylindrical, as well as the tube of the calyx, clothed with silky down; claws of the bundles of stamens very short. H. G. Native of New Holland, on the south-west coast. Flowers red.

5 M. galbifera (Br. l. c.) leaves alternate, oblong, 5-nerved, equal-sided, tapering to the base; heads spherical; capsules connate. H. G. Native of New Holland, on the south coast. Flowers greenish yellow.

6 M. biodosiflora (Andr. bot. rep. t. 476. and R. Br. l. c.) leaves alternate, oval, or lanceolate, obliquely 1-nerved, petiolate, flat, crowded, and as well as the branchlets quite glabrous; spikes oblong, glabrous; bundles of stamens pentandrous. H. G. Native of New Holland, on the south-west coast. M. chloránttha, Bonpl. nav. p. 22. t. 8. M. foliósa, Dumm. Cours. bot. cult. 5. p. 573. Flowers greenish yellow.

7 M. stypheloides (Smith, in Lin. trans. 3. p. 275.) leaves alternate, ovate, acuminate, ending in a pungent mucrone, many-nerved, sessile, glabrous; spikes pubescent; segments of calyx acute, nerved. H. G. Native of New South Wales. R. Br. in Ait. hort. kew. 4. p. 411. M. obliqua, Hort. ex Steud. Flowers white, surrounding the lower part of the branches. This plant has altogether the habit of Styrphelia, from its stiff harsh leaves. M. epacridéa, Hort.

8 M. genistifolia (Smith, exot. bot. l. 1. 55.) leaves alternate, linear-lanceolate, flat, 3-nerved, dotted, and are as well as the branches glabrous; bundles of stamens polyandrous, with their claws about equal in length to the petals. H. G. Native of New South Wales, and where it is called by the English White tea-tree. Flowers with reddish petals and yellow stamens. (f. 117.)

9 M. lanceoláta (Otto. hort. berol. 36.) leaves scattered, lan-

colate, acute, almost nerveless, 3-veined, almost dotted, recurved at the apex, and as are as the branchlets glabrous; spikes loose, naked; bundles of stamens polyandrous, with their claws about equal in length to the petals. H. G. Native of New Holland. Flowers yellowish. Very like M. genistifolia.

10 M. striáta (Labill. nov. holl. 2. p. 26. t. 165.) leaves alternate, lanceolate-linear, acute, obliquely striated, stiff, almost sessile; spikes ovate or oblong; tube of calyx woody; bundles of stamens usually decandrous, with their claws twice the length of the petals. H. G. Native of New Holland, on the south coast. R. Br. l. c. Fruit crowded, nearly globose. Margin of calyx repand. Flowers white.

Striped-leaved Melaleuca. Fl. June, July. Clt. 1803. Sh. 6 to 9 feet.

11 M. pentagoná (Labill. nov. holl. 2. p. 27. t. 166.) leaves alternate, linear-lanceolate, acuminate, thickish, rather 3-nerved; spikes ovate-globose; tube of calyx glabrous, globose, pentagonal; bundles of stamens pentandrous. H. G. Native of New Holland, in Van Lewin's Land. Fruit crowded, in a globose head. Stamens joined together to the middle in bundles. Flowers white.

Pentagonal-fruited Melaleuca. Shrub 4 to 6 feet.

13 M. thyriódes (Labill. l. c. t. 167.) leaves alternate, lanceolate, or oblong, 3-nerved, petiolate, and are as well as the branchlets quite glabrous; heads of flowers globose or oval; segments of the calyx acute, 3-nerved; bundles of stamens usually decandrous, with their claws shorter than the petals. H. G. Native of New Holland, in Van Lewin's Land, and on the south-west coast. R. Br. in hort. kew. 4. p. 412. Flowers purplish. Perhaps the same as M. lucídula of Hort.

14 M. sáqu'mea (Labill. l. c. p. 28. t. 158.) leaves lanceolate-ovate, acuminate, 3-nerved, when young villous as well as the branchlets; heads of flowers globose, pubescent; bundles of stamens bearing 3-6 anthers each, with very short claws. H. G. Native of Van Dieman's Land. R. Br. in hort. kew. 4. p. 412. Ker. bot. reg. t. 477. Flowers thin, much crowded. Fruit coricate by the scaly spongy calyx. Leaves becoming black on drying.

15 M. nóxóa (Smith, exot. bot. 1. p. 67. t. 35.) leaves alternate, linear-subulate, mucronate, stiff, 1-nerved, flat, and rather spreading; heads globose; segments of the calyx membranous, glabrous; bundles of stamens bearing 3-6-8 anthers, with the claws very short. H. G. Native of New Holland, on the eastern coast, at Port Jackson. Vent. malm. t. 112. R. Br. in Ait. hort. kew. 4. p. 418. Metrosideros, Garnt. fruct. 1. p. 172. t. 34. Cav. Icon. 4. p. 19. t. 334. Metrosideros pungens, Reich. in Sieb. pl. exsic. no. 316. Flowers pale yellow. Fruit disposed in a small globose head.

16 M. tenúfolia (D. C. prod. 3. p. 213.) leaves alternate, subulate, nearly terete, mucronate, stiff, distinctly erect, villous when young, but glabrous in the adult state, as well as the branches; heads of fruit globose, dense; calyces rather velvety, with deciduous truncate lobes. H. G. Native of New Holland, on the east coast. Flowers unknown. Allied to M. no-
M. ERICEFOLIA (Smith, exot. bot. t. 34.) leaves alternate, linear-subulate, nerveless, awnless, spreading or somewhat recurved; spikes of flowers oval, glabrous; bundles of stamens octandrous or decandrous, with their claws hardly exceeding the petals.  información necesaria para el texto original.

18 M. ARMILLARIAE (Smith, in Lin. trans. 3. p. 277.) leaves alternate, linear-subulate, mucronate, recurved at the apex; spikes cylindrical, quite glabrous; bundles of stamens polyandrous, with their claws exceeding the petals.  información necesaria para el texto original.

19 M. uncinaT (R. Br. in Ait. hort. kew. 4. p. 414.) leaves alternate, angular, filiform, mucronate, erect, unequally recurved at the apex; branchlets twiggy; heads of flowers ovate, with the rachis woolly; bundles of stamens pentaentous and hexandrous, with their claws exceeding the petals.  información necesaria para el texto original.

20 M. scabra (R. Br. l. c.) leaves alternate, nearly terete, mucronulate, scabrous, crowded; heads of flowers globose; bundles of stamens bearing 4-6 anthers, with their claws about equal in length to the petals.  información necesaria para el texto original.

Juniper-like Melaleuca. Shrub 2 to 4 ft.

22 M. erubescens (Otto, hort. berol. p. 37.) leaves alternate, linear-subulate, flat above, and mucronulate at the apex; spikes cylindrical, and arc, as well as the branchlets, quite glabrous; bundles of stamens polyandrous, with their claws exceeding the petals.  información necesaria para el texto original.

23 M. fulfeoH (R. Br. in Ait. hort. kew. 4. p. 414.) leaves scattered or nearly opposite, oval or oblong, obtuse, obsolescent 3-nerved; flowers usually solitary, and arc, as well as the branches glabrous; bundles of stamens polyandrous, petalsoid on the outside, bearing the stamens from the base to the apex on the margins inside, exceeding the petals.  información necesaria para el texto original.

Leaves opposite.  información necesaria para el texto original.

24 M. thymifolia (Smith, exot. bot. 1. t. 36.) leaves opposite, lanceolate, nerveless; spikes few-flowered; bundles of stamens polyandrous, with the claws branched on the inside even to the middle.  información necesaria para el texto original.

25 M. decussata (R. Br. l. c. p. 415.) leaves opposite, decussate, oval-lanceolate, 3-nerved; spikes oval, quite glabrous; bundles of stamens polyandrous, with the claws very short.  información necesaria para el texto original.

26 M. cuticularis (Labiil. nov. holl. 2. p. 30. t. 171.) leaves opposite, crowded, oblong-linear, obtuse, veinless; flowers solitary, axillary, glabrous; bundles of stamens dodecandrous, having their claws the length of the petals.  información necesaria para el texto original.

Cuticular Melaleuca. Tree 10 to 20 ft.

27 M. fulgens (R. Br. l. c.) leaves opposite, lanceolate-linear, acute, 1-nerved; spikes of flowers oval, quite glabrous; bundles of stamens polyandrous, palminately many-cleft, having their claws the length of the petals.  información necesaria para el texto original.

28 M. LINEARIFOLIA (Smith, exot. bot. t. 56.) leaves opposite, lanceolate-linear, acute, 3-nerved at the base, dotted; spikes of flowers oblong, glabrous, as well as the branchlets; bundles of stamens polyandrous, pinnate-parted, exceeding the petals.  información necesaria para el texto original.

29 M. abietina (Smith in Rees' cyc. vol. 23. no. 15.) leaves opposite, elliptic-oblong, concave, obtuse, 3-nerved; flowers few, glabrous at the tops of the branches; bundles of stamens polyandrous, having elongated claws, but not exceeding the petals, multifid at the apex.  información necesaria para el texto original.

Fir-like Melaleuca. Tree 20 to 30 ft.

30 M. HYPERICIFOLIA (Smith in Lin. trans. 3. p. 249.) leaves opposite, decussate, elliptic-oblong, 3-nerved, the lateral nerves are obsolete, approximating the margin, which is recurved; spikes cylindrical, quite glabrous; bundles of stamens polyandrous, unguiculate, elongated; filaments radiating.  información necesaria para el texto original.

Fir-like Melaleuca. Tree 20 to 30 ft.
MYRTACEÆ. XI. MELALEUCA.

31. M. elliptica (Labill. nov. holl. p. 31. t. 173.) leaves opposite, elliptic, blunt at both ends, 1-nerved in the middle, with the veins pinnate, and confluent at the margins; spikes of flowers cylindrical, pubescent; bundles of stamens polyandrous, with their claws exceeding the petals. \( \psi \). G. Native of New Holland, and Van Dieman's Land. Flowers scarlet, rather smaller than those of the preceding species. Fruit glabrous, glabrous. Lobes of calyx acute, permanent.

Elliptic-leaved Melaleuca. Shrub 4 to 6 ft.

32. M. Saurios (Smith in Lin. trans. 6. p. 300.) leaves opposite, ovate, acute, 3-7-nerved, on short petioles, glabrous; branchlets villous; spikes cylindrical; bracteoles foliaceous; lobes of calyx blunt and nerves; bundles of stamens dodecandrous, with their claws the length of the petals; fruit appearing as if they were sunk in the branches at the base. \( \psi \). G. Native of New Holland and Van Diemen's Land. Clt. nov. holl. 2. t. 169. Smith, bot. mag. t. 1935. M. myrtifolia, Vent. malm. t. 47. M. capputi, Hort. Flowers yellowish.

33. M. gibbosa (Labill. nov. holl. p. 2. t. 172.) leaves opposite, decussate, crowded, ovate, obtuse, 3-nerved; spikes few-flowered, and are, as well as the branches and calyxes, glabrous; bundles of stamens polyandrous, with their claws the length of the petals; fruit appearing as if they were sunk in the branches at the base. \( \psi \). G. Native of Van Diemen's Land and of New Holland on the south coast. M. imbricata, Hort. There is a variety of this species with 3 leaves in a whorl.

Gibbous Melaleuca. Clt. 1820. Shrub 6 to 12 ft.

34. M. Sprengeloides (B. C. prod. 3. p. 215.) leaves opposite, decussate, sessile, crowded, roundish, mucronate, 3-nerved; heads of flowers nearly globose, crowded, glabrous; bundles of stamens bearing 7-10 anthers, with their claws the length of the petals; fruit nearly globose, with a truncate, somewhat inflated limb. \( \psi \). G. Native of New Holland. Allied to M. gibbosa, but very distinct.

Sprengeloides-like Melaleuca. Shrub 6 to 8 ft.

35. M. Calyca (R. Br. in Ait. hort. kew. 4. p. 416.) leaves opposite, ovate-lanceolate, 3-5-nerved, nearly sessile; glomerules few-flowered; segments of the calyx acute, nerves; bundles of stamens polyandrous, with their claws shorter than the petals. \( \psi \). G. Native of New Holland, on the southern coast. Flowers purple.

*** Leaves in whorls.

36. M. De'nsa (R. Br. l. c.) leaves scattered, 3 in a whorl or opposite, obovate, 3-nerved; spikes oblong or oval. \( \psi \). G. Native of New Holland, on the south-west coast. Flowers reddish.

37. M. Inca (R. Br. in bot. reg. t. 410.) leaves 3 in a whorl, linear-lanceolate, clothed with hoary down on both surfaces, as well as the branches; spikes oval or oblong. \( \psi \). G. Native of New Holland. M. tomentosa, Colla, hort. rip. 87. t. 37. M. lanata, Nois. M. canescens, Link et Otto, hort. berol. p. 87. C. t. 81. M. lanigera, Wend. Bundles of stamens bearing each 5-7 anthers, with their claws shorter than the petals. Flowers pale yellow.

† Species not sufficiently known.

38. M. Microphylla (Smith in Rees' cycl. vol. 23. no. 9.)

XII. LAMARCHEA. XIII. EUSDANIA.

leaves alternate, imbricate, cylindrical, obtuse, somewhat spathulate; spikes oval on the upper part of the branches; calyxes glabrous. \( \psi \). G. Native of New Holland, at King George's Sound. From the flowers being pedicellate, and the bundles of stamens not exceeding the petals, it is therefore perhaps a species of Tristania or Astrolora.

Small-leaved Melaleuca. Shrub.

39. M. Tetragina (Dodd. ex Otto, hort. berol. p. 37.) leaves opposite, decussate, ovate-elliptic, 3-nerved. \( \psi \). G. Native of New Holland. Allied to M. decussata, but the leaves are broader, much less dotted, more remote, and more spreading. Flowers unknown.

Tetragonal Melaleuca. Clt. 1820. Shrub 4 to 6 ft.

†† Species only known by name. Many of them may prove identical with some of those described above.

Cult. The greater part of the species of Melaleuca are desirable green-house or conservatory plants, their foliage being neat, and in some the blossoms are splendid. Their culture and propagation are the same as recommended for Tristania, see p. 813.

XII. LAMA'RCHA (dedicated to A. M. Lamarche, a captain in the French navy, formerly lieutenant of the ship Uranie, under captain Freycinet in his voyage round the world; a particular friend of Gaudichau's). Gaud. in Freyc. voy. part. bot. p. 483. t. 110.

Lin. syst. Iconandra, Monogynia. Calyx hemispherical, with a 3-parted regular deciduous limb. Petals 5, inserted in the limb of the calyx, obovate-spatulate, ciliately fringed at the apex, campanulately convolute, exceeding the limb of the calyx. Stamens numerous, inserted with the petals, monadelphous, exceeding the corolla. Staminiferous tube a little arched, divided into 5 polyanthous parts even to the middle. Ovarium glabrous, free. Style crowned by a subcapitate stigma. Capsule globose, chartaceous, 3-celled, dividing into 3 valves at the dissepiments; placenta 3, fixed to the axis of the capsule. Seeds numerous, uncutent or lanceolate, arched triangular, erectly ascending.—An unarmed tree, with scattered, linear-lanceolate, quite entire, 3-nerved, coriaceous leaves. Flowers axillary, solitary, sessile, brownish purple, lateral after the leaves have fallen.

1. L. Hakeaefolia (Gaud. I. c. t. 484. 110.) \( \psi \). G. Native of the Sandwich Islands.

Hakea-leaved Lamarchea. Tree.

Cult. For culture and propagation see Tristania, p. 813.

XIII. EUDEANIA (from eu, well, and ἑκεν = desme, a bundle; in reference to the stamens being connected into 4 bundles). R. Br. in gen. rem. p. 67. t. 3. D. C. prod. 3. p. 216.

Lin. syst. Polygadephia, Polyandria. Tube of calyx tubinate; limb 4-cleft. Petals closely joined into 4-striped deciduous hemispherical operculum. Stamens definite, joined into 4 polyanthous bundles, which alternate with the teeth of the calyx, and therefore opposite the petals. Capsule 4-celled, 4-valved, opening at the apex.—A New Holland shrub, with tetragonal branches. Leaves nearly opposite, broad-lanceolate, coriaceous, glaucous. Peduncles axillary, bearing umbels of white flowers.

1. E. Tetragina (R. Br. l. c.) \( \psi \). G. Native of New Holland, at Lucky Bay. Sweet, fl. austr. t. 21. Lindl. bot. reg. with a figure.

Cult. For culture and propagation see Tristania, p. 813.
SUBTRIBE 11. EULIPPOSPERMÆ (from ev, well, and leptospermum; this subtribe contains plants agreeing with Leptospermum in the free stamens). D.C. prod. 5. p. 216. Stamens free.

XIV. EUCALYPTUS (from eu, well, and kalos, beautiful; in reference to the form of the flowers covering the flower before expansion, and afterwards falling off in one piece, in the shape of a lid or cover (f. 118. b)).

LHER. 15. D. C. prod. 3. p. 216. 

LIN. SYST. Icosandra, Monogyne. Tube of calyx permanent, obovate or globose (f. 118. a), cup-shaped; limb in the form of a lid, entire, cut round regularly at the base, and falling off in one piece (f. 118. b). Petals wanting. Stamens numerous (f. 118. d), free. Capsule 4-celled (f. 118. c), or only 3-celled from abortion, opening at the apex, many-seeded. — Tall trees, natives of New Holland. Leaves quite entire, coriaceous, usually alternate, rarely opposite, very variable even in the same tree, quite glabrous except in a very few of the species. Peduncles axillary, bearing an umbel of from 3-5 flowers. Flowers white. The operculum of the calyx in some, according to Mr. Brown, (gen. rem. p. 68.) is double, the outer in the form of a calyx, and the inner the form of a corolla. There are about 100 species in New Holland (R. Br. gen. rem. p. 15.), of which hardly a half are rightly known. In Van Diemen’s Land a manufactory has been established for the preparation of extract of tannin from the bark of various species of Eucalyptus. A considerable quantity of the substance has been recently imported into England, and it has been said by tanners to be twice as powerful in its operation as oak-bark.

§ 1. Alternifoliâ (from alternus, alternate, and folium, a leaf). Leaves alternate.

* Operculum conical, longer than the calycine cupula.

1 E. coriacea (Labill. voy. 1. p. 403. t. 20. nov. holl. 2. t. 221.) Operculum cone-formed, 5 times longer than the cupula; base of style permanent; flowers capitate at the top of the terete peduncles; leaves linear-lanceolate. G. Native of New Holland, in Van Lewin’s Land.

Horned Eucalyptus. Ch. 1803. Tree 30 ft.

2 E. tereticornis (Smith in Lin. trans. 3. p. 354. nov. holl. 41.) Lid conical, terete, smooth and membranous, broader, and 3 times longer than the cupula; umbels lateral; leaves lanceolate, oblique at the base. G. Native of New Holland.

Terete-horned Eucalyptus. Ch. 1804. Tree.

3 1. E. resiniâ (Smith in Whit. voy. p. 581. t. 25. ex exot. bot. 2. p. 49. t. 84.) Lid conical, terete, coriaceous, twice the length of the cupula; peduncles of umbrella somewhat compressed, a little longer than the pedicles; leaves ovate-lanceolate, long-acuminated, attenuated at the base, margined by a nerve. G. Native of New Holland. Andr. bot. rep. t. 400. Hayn. arznn. gew. 10. t. 5. Metrosideros gunneri, Goertn. fruct. 1. p. 173. t. 34. f. 1. Leaves full of minute dots. A resin something like kino has been produced from this species, and for all medical purposes full as efficacious.

** Operculum conical, equal in length to the cupula. 

5 E. robusta (Smith in Lin. trans. 3. p. 283. spec. nov. holl. p. 39. t. 13.) Operculum conical, constricted in the middle, length of the cup, and broader than it; peduncles lateral and terminal, 2-edged; pedicels short, compressed; leaves ovate. G. Native of New Holland.

Par. β, hostrastræ (Car. icon. 4. t. 342.) Leaves ovate-lanceolate, acuminate, coriaceous, girded by a marginal parallel nerve. G. Native of New Holland. E. robusta, Sieb. & Zucc. ex appointed. nov. holl. no. 480.

Robust Eucalyptus. Fl. Aug. Sept. Ch. 1794. Tr. 100 ft. 6 E. marginata (Smith in Lin. trans. 6. p. 302.) Lid of calyx conical, length of cup; umbels lateral; leaves ovate, with thickened margins. G. Native of New Holland. Margin of leaves cartilaginous and reddish. Operculum not constricted as in E. robusta, to which it is very nearly allied.

Marginate-leaved Eucalyptus. Fl. April, June. Ch. 1794. Tree.

7 E. incrassatâ (Labill. nov. holl. 2. p. 12. t. 150.) Lid of calyx conical, somewhat constricted nearly the length of the calyx; peduncles axillary, 2-edged, as well as the pedicels, which are short; leaves oblong-lanceolate, thickish, rather acuminate, girded by a thin nerve, which is parallel with the margin. G. Native of New Holland, in Van Lewin’s Land. Marginal nerve of leaf visible beneath. Lower surface of leaves pale.

Thickened Eucalyptus. Ch. 1818. Shrub 6 ft.

8 E. persicifolia (Lodd. bot. cab. t. 501.) Lid of calyx conical, a little shorter than the cupula; peduncles axillary, 2-edged, length of the pedicle; pedicels short, compressed; leaves oblong, attenuated at the base, acuminate at the apex, marked with a narrowly parallel, very thin nerve on the margin. G. Native of New Holland. Lodd. bot. cab. 501. Umbels 8-10-flowered. Leaves 3 inches long and 6 inches broad.

Var. β; leaves a little broader; peduncles shorter. Eucalyptus, Sieb. pl. exsic. nov. holl. no. 593.

Var. γ; leaves a little longer; peduncles exceeding the pedicels a little. E. incrassatâ, Sieb. ex Sieb. et Zucc. nov. holl. no. 477. E. multiflorum, Poir. suppl. 2. p. 594.

9 E. functâ (from fudus, a flower-bud; of calyx conical, longer than the cupula; peduncles axillary at the tops of the branches, shorter than the pedicels, and are, as well as the pedicels, 2-edged; leaves obl. at the base, acuminate at the apex, dotted beneath, and girded by a nerve, which is parallel to the margin. G. Native of New Holland. Sieb. pl. exsic. nov. holl. no. 629. Leaves more distinctly margined than the preceding. Operculum not constricted in any way. Umbels 4-5-flowered. Dots on the under surface of the leaves blackish. Leaves 3 inches long, and 7-8 lines broad.

Dotted-leaved Eucalyptus. Tree.

10 E. acephala (Sieb. pl. exsic. nov. holl. p. 469.) Lid of calyx conical, length of the cupula; peduncles lateral, shorter than the pedicels, and are, as well as the pedicels, 2-edged; leaves ovate-lanceolate, oblique at the base, and very much cut on one side, acuminate at the apex. G. Native of New Holland. Leaves 4-5 inches long, and about an inch broad. Umbels 4-5-flowered. Alabastrum or flower-bud 3 lines long.

Little-horned Eucalyptus. Tree.

11 E. virga (Sieb. l. c. no. 467.) Lid of calyx conical, length of the cupula; peduncles axillary and lateral, hardly longer than the pedicels, and are 2-edged, as well as the pedicels; leaves oblong-linear, acuminated at both ends, thickish, coriaceous, and nearly veinless. G. Native of New Holland. Leaves 4-6 inches long, and about 6-9 lines broad.
axillary and nearly terminal; umbels 15-20-flowered; leaves oblong, coriaceous, attenuated at the base, long-acuminated, with the nerves confluent in front of the margins.  \( \gamma \). G. Native of New Holland. Sieb. Pl. exsic. no. 497. Leaves shining on both surfaces, 6-7 inches long, and 1 broad, having the veins feathered. Alabastrum ovado, smaller than that of any other species.

Small-flowered Eucalyptus. Tree.

13. E. \textit{stellulata} (Sieb. l. c. no. 487.) lid conical, length of the cupula; peduncles lateral, very short, nearly terete; umbels 15-20-flowered; leaves oblong, tapering to both ends, 3-5-nerved at the base.  \( \gamma \). G. Native of New Holland. Petioles and peduncles 3 lines long. Leaves 3 inches long, and half an inch broad, rather coriaceous, and a little shining. Flower-bud oblong, tapering to both ends, 2 lines long.

Starry Eucalyptus. Tree.

14. E. \textit{oblonga} (D. C. prod. 3. p. 217.) lid of calyx conical, length of the cupula; peduncles lateral and axillary, compressed, length of the petals; umbels 8-12-flowered; leaves oblong, unequal at the base and attenuated, mucronate at the apex, coriaceous, veinless.  \( \gamma \). G. Native of New Holland. Sieb. Pl. exsic. no. 583. Flower-bud oblong, attenuated at both ends, nearly sessile on the tops of the peduncles, and a little shorter than them. Leaves 3-4 inches long, and 9 lines broad.

Oblong-leaved Eucalyptus. Tree.

15. E. \textit{viminatis} (Labill. nov. holl. 2. p. 12. t. 151.) oculcum conical, hardly acute, length of the cupula; peduncles axillary and lateral, compressed, shorter than the petals; flowers sessile, 3 on the top of each peduncle; leaves linear-lanceolate.  \( \gamma \). G. Native of Van Diemen's Land. Capillus hemi-vascular. Leaves 3 inches long, and 4-5 lines broad. Intermediate between the first and second division of the genus.

Triggy Eucalyptus. Cl. 1810. Tree.

16. E. \textit{capitellata} (Smith in White, voy. p. 226. nov. holl. t. 43.) lid of calyx conical, bluntish, length of the cup, which is angular, and somewhat 2-edged; peduncles lateral; flowers capitate; leaves ovate-lanceolate, stiff, oblique.  \( \gamma \). G. Native of New Holland. E. triantha, Link, enum. 2. p. 20. and perhaps of Spreng. syst. 2. p. 501.

Headed-flowered Eucalyptus. Cl. 1804. Tree.

17. E. \textit{salicyna} (Smith in Lin. trans. 3. p. 285.) oculcum acute, and is, as well as the cup angularly 2-edged; peduncles lateral, short; flowers capitate; leaves linear-lanceolate.  \( \gamma \). G. Native of New Holland. Flowers small. Calyx triangular. Fruit turbinate. E. angustifolia, Link, enum. 2. p. 30. ex Spreng.

Willowy-leaved Eucalyptus. Cl. 1804. Tree.

*** Oculcum nearly conical or hemispherical, shorter than the cupula.

FIG. 118.

18. E. \textit{ovata} (Labill. l. c. p. 13. t. 153.) lid of calyx hemispherical, mucronate, shorter than the cup; peduncles axillary, and somewhat terminal, nearly terete, shorter than the pedioles; flowers 3-5-together, capitate; leaves ovate, mucronate, a little crenated.  \( \gamma \). G. Native of New Holland, in Van Lewin's Land. Leaves coriaceous, some entire, and others irregularly crenated. E. mucronata, Link, enum. 2. p. 30. E. androsemfolia, Hoffin, verz. 1826. Pe-
lines broad. Petioles and peduncles 3-4 lines long. Perhaps the same as E. salicifolia, Cav. icon. 4. p. 376.

*Piretia*-like Eucalyptus. Tree.

25 E. amygdalina (Labill. nov. holl. 2. p. 14. t. 154.) lid hemispherical, nearly mutic, shorter than the cup; peduncles axillary and lateral, nearly terete, length of the petioles; umbels 8-9-flowered, nearly capitate; leaves linear-lanceolate, attenuated at the base, and acuminately mucronate at the apex.  ½. G. Native of Van Dieman's Land. Metrosideros salicifolia, Gaertn. fr. 1. p. 171. t. 24. f. 3. a. but not b. E. globularis, Hort. Leaves 3 inches long, and 3 lines broad, some unequal at the base, and some equal. Petioles and peduncles 3 lines long. Fruit globose, size of a grain of pepper.

*Almond*-like Eucalyptus. Ct. 1820. Tree.

26 E. Amigua (D. C. prod. 3. p. 219.) lid hemispherical, mucronate, shorter than the cupula; peduncles axillary, compressed, length of the petioles; umbels capitate, 8-9-flowered; leaves lanceolate, rather coriaceous, unequally attenuated at the base, and acuminately mucronate at the apex. ½. G. Native of New Holland. Allied to E. leigistrina and E. amygdalina, but the fruit is nearly globose, and twice the size. Petioles and peduncles 2-3 lines long. Leaves 2-3 inches long, and 6-12 lines broad, stiltish; lateral veins hardly evident.

*Ambiguous* Eucalyptus. Tree.

27 E. lindeyana (D. C. prod. 3. p. 219.) operculum hemispherical, nearly mutic; peduncles nearly terete; flowers 3-5 in an umbel; leaves linear-lanceolate, some petiolate and ecatuated at the base, others sessile and obtuse at the base. ½. G. Native of New Holland. E. longifolia, Lindl. bot. reg. t. 947.

28 E. boothyoides (Smith in Lin. trans. 3. p. 286.) lid of calyx hemispherical, rather mutic; peduncles nearly terete; flowers 3-5 in an umbel; leaves linear-lanceolate, some petiolate and ecatuated at the base, others sessile and obtuse at the base. ½. G. Native of New Holland. E. platy-podos, Cav. icon. 4. p. 23. t. 341. Fruit turbinate, ex Smith, but cylindrical according to Cav.

29 E. Piperata (Smith, l. c.) operculum hemispherical, mucronate, shorter than the cup; peduncles axillary and lateral, compressed, shorter than the petioles; umbels 5-6-flowered; branchlets angular; leaves lanceolate, coriaceous, acuminated, 1-nerved, and somewhat many-nerved at the base. ½. G. Native of New Holland. White, trav. p. 226. with a figure. Rehb. gart. mag. t. 42. Petioles 8 lines long. Peduncles 4 lines long. Leaves 4-6 inches long, and an inch broad, shining on both surfaces.

Var. β, paniciflora (Sieb. pl. exsic. no. 470.) leaves longer; umbels fewer-flowered. ½. G. Native of New Holland.

*Peppery* Eucalyptus. Ct. 1788. Tree.

30 E. fallens (D. C. prod. 3. p. 219.) lid of calyx hemispherical, nearly awnless, shorter than the cupula; peduncles axillary, compressed, length of the petioles; umbels 5-7-flowered; branchlets angular; leaves lanceolate, coriaceous, axillary, feather-nerved; veins confluent in front of the margins. ½. G. Native of New Holland. Sieb. pl. exsic. no. 606. Petioles 5 lines long. Leaves 5 inches long, hardly oblique at the base, and nearly an inch and a half broad, white on both surfaces.

*Pale-leaved* Eucalyptus. Tree.

31 E. obliqua (Linn. sert. angl. p. 18.) lid of calyx hemispherical, mucronate, shorter than the cupula; peduncles axillary and lateral, and are, as well as the branches, nearly terete, length of the petioles; umbels 5-12-flowered; leaves broad, lanceolate, acuminated, very unequal at the base, feather-nerved. ½. G. Native of New Holland. Lam. ill. t. 422. Salv. par. Lond. 15. Smith, nov. holl. 13. Leaves 6-7 inches long, and 2 inches broad. Petioles and peduncles an inch long. *Old-type*-leaved Eucalyptus. Fl. July, Aug. Ct. 1774. Tr. 100 ft.

32 E. corymbosa (Smith in Lin. trans. 3. p. 287. nov. holl. p. 43.) operculum hemispherical, mucronate, shorter than the cup; peduncles angular, disposed in a terminal corymb; leaves lanceolate, equally attenuated at the base, coriaceous. ½. G. Native of New Holland. Cav. icon. t. 340. Fruit turbinate. Petioles half an inch long. Leaves 4 inches long, and one broad. Veins feathered, hardly evident. The *E. corymbosa* of the gardens is probably distinct from this, but the flowers have not been seen.

*Corymbosa*-flowered Eucalyptus. Ct. 1788. Tree.

33 E. paniculata (Smith, l. c.) operculum hemispherical, mucronate, shorter than the cup, which is angular; peduncles angular, lower ones axillary, the rest disposed in a terminal corymb; leaves lanceolate, equally attenuated at the base, coriaceous. ½. G. Native of New Holland, on the eastern coast. Alabastrum with the lid or operculum about 4 lines long, obtuse. Flowers sessile on the tops of the peduncles. Petioles 4 lines long. Leaves 2 inches long, and 5-6 lines broad. The middle nerve is only prominent or even evident.

*Panicled*-flowered Eucalyptus. Ct. 1804. Tree.

34 E. oreophylla (D. C. prod. 3. p. 220.) lid of calyx hemispherical, nearly mutic, shorter than the cupula, which is turbinate; peduncles nearly terete, axillary, length of the petioles; flowers 5-7 in a head; leaves linear-lanceolate or oblanceolate, unequally attenuated at the base, coriaceous. ½. G. Native of New Holland, on the eastern coast. Very like the preceding species, but differs in the flowers being larger, in the cup of the calyx being obvate, in the operculum being blunter, and in the leaves being broader. The margins of the leaves are deciduous as in the preceding species.

*Blunt-leaved* Eucalyptus. Tree.

**** *Operculum* hemispherical, much broader than the cupula.

36 E. conhoecithala (D. C. prod. 3. p. 220.) operculum hemispherical, obtuse, rather striated, much broader than the cup, and a little longer; peduncles 2-edged, length of the petioles, nearly terminal; flowers 3-4 in each head or umbel; leaves lanceolate, acuminate, coriaceous. ½. G. Native of New Holland. Petals wanting. Stamens very numerous. Fruit angularly compressed, rather turbinate, 4-celled. Petioles an inch long, terete. Leaves glaucous, veinless, 5 inches long, and one broad.

*Club*-flowered Eucalyptus. Tree.

**** *Native operculum* depressed in the centre, where it is unlobate, shorter than the cupula.

37 E. globulus (Labill. voy. 1. p. 153. t. 13. nov. holl. 2. p. 121.) operculum conical, when young length of the cup, which is tetragonal, but in the adult state it is depressed, and mucronate in the centre; peduncles axillary, short, 1-flowered; leaves alternate, lanceolate, nearly falcate. ½. G. Native of Van
Dieman's Land and New Holland. Petioles an inch long. Leaves 7-8 inches in diameter, flat on the top. E. globularis, Hort. is probably distinct from this in the leaves.

**Globuled Eucalyptus.** Clt. 1810. Tree 150 ft.

§ 2. **Oppositifolia** (from *oppositus*, opposite, and *folium*, a leaf). *A series of the leaves are opposite and sessile, and others petiolate and alternate.*

38. **E. diversifolia** (Bonnpl. nav. 1. p. 35. t. 13.) operculum conical, length of the cup, which is turbinate; peduncles axillary, terete; flowers 5-7 in each tuft; lower leaves opposite, sessile, ovate, obtuse: upper ones alternate, petiolate, lanceolate, acuminated by a mucrone. $\&$. G. **Native of New Holland**, in Kangaroo Island. E. connata, Dc. Cours. bot. cult. 7. p. 280. $\&$. E. *piperita*, Hort. berol. Fruit hemispherical, 5 lines in diameter, flat at the top. Pericarp cross-formed at the apex. Leaves 2-3 inches long, lower ones an inch and a half broad, but the upper ones are only half an inch broad. Branches terete, but when young compressed. E. heterophylla, Sweet?

**Diverse-leaved Eucalyptus.**

39. **E. fulvogena** (Cunningh. in Field's new south wales, p. 350.) leaves opposite, sessile, rather connate at the base, nearly orbicular, retuse, cupulata at the apex, with thickened undulate margins; umbels axillary, pendunculate, 3-flowered; pedicels very short, terete. $\&$. G. **Native of New Holland**, near Cox's River. Operculum hemispherical, acute.

**Powder-bearing Eucalyptus.** Clt. 1824. Tree.

40. **E. cordata** (Labill. nov. holl. 2. p. 13. t. 152.) operculum with the margin depressed, and the middle umbonate, shorter than the cup, which is obovate; peduncles axillary and terminal, short, and rather angular; flowers 3-4 in each head, leaves for the most part opposite, sessile, cordate, usually erect; branchlets terete. $\&$. G. **Native of New Holland**, at Cape Van Dieman. Lodd. bot. cab. t. 323. Fruit nearly globose, 4-5 lines in diameter. Branches and young leaves glaucous. Leaves usually obtuse, 2 inches long and an inch and a half broad.

**Cordate-leaved Eucalyptus.** Fl. June. Clt. 1816. Tr. 60 ft.

41. **E. pulvululentata** (Sims, bot. mag. t. 208.) operculum hemispherical; peduncles short, axillary; flowers 3 in each head; leaves opposite, ovate-orbicular, rather mucronate, cordate, covered with glaucous powder, quite entire; branchlets terete. $\&$. G. **Native of New Holland**. E. *cordata*, Hort. berol. Perhaps distinct from the preceding species. Perhaps the operculum is truly hemispherical.

**Powdery Eucalyptus.** Clt. 1816. Tree.

† Doubtful species, in consequence of the flowers being unknown. Many of which are probably identical with some of those described above, especially among those with alternate leaves.

* Leaves opposite.

42. **E. glauca** (D. C. prod. 3. p. 291.) operculum unknown; leaves glaucous and powdery; lower ones opposite, sessile, stem-clasping, cordate, ovate, mucronate; middle ones on short petiolates, and about opposite; upper ones alternate, petiolate, lanceolate, and acuminate; branches 4-winged or quadrangular. $\&$. G. **Native of New Holland**. E. perfoliata, Hort. E. pulvululentata, Link, enum. 2. p. 31. Leaves very variable on the same plant, both with regard to size and shape.

**Glaucescent Eucalyptus.** Clt. 1820. Tree.

43. **E. purpurascens** (Link, enum. 2. p. 31.) leaves opposite, stem-clasping, lanceolate, long-acuminate, glaucous beneath.

* G. **Native of New Holland.** Branches and nerves of leaves purplish. Leaves 4 inches long and 10 lines broad. Perhaps the two following varieties are the same, only differing in the shape of the leaves from the age of the plants.

44. **E. tuberculata** (Parrn. h. ex Otto. hort. berol.) leaves opposite, sessile, stem-clasping, oblong-linear, acute, membranous, glabrous; branches filiform, tubercular. $\&$. G. **Native of New Holland**. E. verrucosa, Hort. ex Loud. hort. brit. p. 198.

**Tubercled-leaved Eucalyptus.** Clt. 1832. Tree.

45. **E. cunninghamii**; leaves linear-lanceolate, rather falcate, acute, with thickened margins; umbels many-flowered, and are as well as the leaves crowded. $\&$. G. **Native of New Holland**, forming bushes upon the more elevated of the mountains. E. microphylla, Cunningham, in Field's New south wales, p. 350.

**Cunningham's Eucalyptus.** Clt. 1824. Shrub.

46. **E. rosea** (Hoffmans. verz. 1826. p. 114.) leaves stiff and hard, lower ones sessile, opposite, ovate, rather cordate, obtuse, upper ones petiolate, scattered, lanceolate, acute, and somewhat apiculated; stem and branches terete. $\&$. G. **Native of New Holland**. Flowers and fruit unknown. Perhaps the same as *E. diversifolia*.

**Stiff-leaved Eucalyptus.**

47. **E. hypericifolia** (Dc. Cours. bot. cult. 7. p. 279.) leaves opposite, lanceolate-oblong, acute, glaucous beneath; branches filiform. $\&$. G. **Native of New Holland**. Petioles half an inch long. Leaves 6 inches long and an inch and a half broad. Lateral nerves of leaves parallel, connected in front of the margin. E. hypericifolia of Link, enum. 2. p. 30. has alternate, nearly linear leaves, which are acuminate at both ends, coriaceous, standing on short petioles, dotted when examined by a lens, but perhaps only the same plant.

**St. John's-wort-leaved Eucalyptus.** Clt. 1823. Tree.

* * Leaves alternate.

**Small-leaved Eucalyptus.** Clt.? Tree.

49. **E. stenophylla** (Link, enum. 2. p. 30.) leaves alternate, linear, attenuated at the base, bluish, veiny, dotted, with the lateral nerves connected before the margin. $\&$. G. **Native of New Holland**. Petioles 4 lines long. Leaves 3 inches long, and 4 lines broad.

**Narrow-leaved Eucalyptus.** Clt. 1823. Tree.

50. **E. myrtifolia** (Link, enum. 2. p. 30.) leaves alternate, on long petioles, ovate, acute, reticulated, dotted; lateral nerves connected before the margins. $\&$. G. **Native of New Holland**. Petioles 3-4 lines long. Leaves 20-21 lines long, and nearly an inch broad.

**Myrtle-leaved Eucalyptus.** Clt. 1823. Tree.

51. **E. elongata** (Link, 1. c.) leaves alternate, lanceolate, reticulately veined, coriaceous, ending in a filiform acumen each. $\&$. G. **Native of New Holland**. Petioles 8 lines long. Leaves 4-5 inches long, and 10-12 lines broad. Perhaps the same as *E. cornuta*, or perhaps *E. pericifolia*. 

**MYRTACEAE. XIV. EUCALYPTUS.**
52 E. media (Link, i. c.) leaves alternate, lanceolate, long-acuminated, ovate, and oblique at the base, with the nerves parallel beneath. h. G. Native of New Holland. Petioles half an inch long. Leaves 6-7 inches long, and from 1-2 inches broad.

53 E. reticulata (Link, i. c.) leaves alternate, lanceolate, acuminate, somewhat ovate at the base, oblique, reticulately veined beneath. h. G. Native of New Holland. Leaves 6-7 inches long and 2 or more broad.

Umbellate-flowered Eucalyptus. Tree.
† The following names occur in the gardens, but they are all perhaps synonymous with those described above.

1 E. orbiculare, Lodd. 2 E. pdchella, Lodd. 3 E. albicaxis, Hort. 4 E. cotinifolia, Lodd. 5 E. undulata, Hort. 6 E. alata, Hort.

**Cult.** For culture and propagation see Thrusta, p. 813.

**Lin. syst. Icosandra, Monogynia.** Tube of calyx turbinate, marked with 5 prominent ribs; limb of 5 permanent teeth. Petals 5. Stamens indefinite, free; anthers ovate. Style filiform. Capsule covered by the coriaceous calyx, obovate, truncate, 3-celled, 3-valved. Seeds solitary, or few in the cells.—Australian shrubs, with opposite leaves, rarely with the rameones ternate. Flowers white.

**Heart-leaved Angophora.** Fl. May, Aug. Clt. 1789. Sh. 7 to 10 feet.

2 A. intermedia (D. C. prod. 3. p. 222.) leaves on short petioles, elliptic-oblong, and are as well as the branches glabrous; peduncles hispid from bristles. h. G. Native of New Holland. Flowers one half smaller than those of the preceding species.

**Intermediate Angophora.** Shrub 4 to 6 feet.

3 A. lanceolata (Cav. l. c. t. 539.) leaves petiolate, lanceolate, acuminate, glabrous, as well as the branches and peduncles. h. G. Native of New Holland, near Port Jackson. Metrosideros splendens, Gartn. fr. 1. p. 171. t. 34. f. 7. Metulicola costata, Rensch. Metrosideros costata and lanceolata, Pers. ench. 2. p. 28. Like the two preceding species, this varies with opposite and alternate leaves.

**Cult.** See Metrosideros for culture and propagation.

**XVI. CALLISTEMON (καλλιστος, *καλλιστος, beautiful, and στυμων, stamen, a stamen; in most of the species the stamens are of a beautiful scarlet colour).** R. Br. in bot. reg. no. 393. D. C. prod. 3. p. 222.—Metrosideros species of authors.

**Lin. syst. Icosandra, Monogynia.** Tube of calyx half spherical; limb 5-parted, with the lobes obsolete. Petals 5 (f. 119. b.). Stamens numerous (f. 119. c.); filaments free. Style filiform. Stigma capitate (f. 119. c.). Capsule 3-celled (f. 119. f.), many-seeded, inclosed, and conuate with the thickened tube of the calyx, which is adnate to the branches.—New Holland shrubs, having the inflorescence rising from the old branches in crowded spikes, as in the species of Melaleuca; but with the stamens free, in Metrosideros. Leaves elongated, stiff, alternate, usually lanceolate.

* Filaments of stamens yellowish.

**Pincleaved Callistemon.** Fl. June, Jul. Clt. ? Sh. 4 to 6 ft.

2 C. viridiflorum (D. C. l. c. 1.) leaves linear-lanceolate, stiff, pungent, bitter with sebaceous dots, rather villous when young as well as the branches; calyx glabrous. h. G. Native of New Holland, on the east coast. Metrosideros viridiflora, Sims, bot. mag. 2602. Petals and stamens yellowish green. Filaments deflexed, 4-times the length of the corolla, e. Sims. Fruit globose; limb of calyx deciduous.

3 C. salignum (D. C. l. c. 1.) leaves lanceolate, acuminate at both ends, mucronate, glabrous in the adult state, with the middle nerve feather-veined, and the lateral nervesveles approximating the margins; calyces glabrous. h. G. Native of New Holland. Metrosideros saligna, Smith, in Lin. trans. 3. p. 272. Vent. hort. cels. t. 70. Bonpl. nav. t. 4. Sieb. pi. exsic. no. 320. Flowers pale yellow. Stamens hardly 3-times the length of the petals, which are roundish.

**Willowy Callistemon.** Fl. July, August, Clt. 1788. Shrub 4 to 6 feet.

4 C. lobanthum (Sweet, fl. aust. t. 29.) leaves lanceolate, attenuated at both ends, mucronate, 1-nerved, and feather-veined, glabrous in the adult state, but villous when young as well as the branches; flowers scarcely, spicate, nearly terminal; calyx pilose; petals rather pubescent, ciliate; ovary densely clothed with down; capsule distinct. h. G. Native of New Holland. Metrosideros lobanthum, Vent. hort. cels. t. 69. Metros. saligna, Sims, bot. mag. 1821. Flowers straw-coloured.

**Crest-flowered Callistemon.** Fl. June, Aug. Clt. 1806. Shrub 4 to 6 ft.

5 C. leucholepis (Sweet, fl. aust. no. 29.) leaves lanceolate, acute, mucronate, attenuated at both ends, full of dots, 1-nerved, and feather-veined, glabrous in the adult state, when young clothed with silky tomentum as well as the branches; spikes long, slender; calyx pilose; petals pubescent, ciliate; ovaries smooth; capsules crowded. h. G. Native of New Holland. Flowers greenish yellow.

Pall-flowered Callistemon. Shrub 4 to 6 feet.

7 C. Sieberi (D. C. l. c.) leaves linear, almost nerveless, and with the midrib hardly prominent, clothed with silky villi when young, but glabrous in the adult state; the lateral nerves wanting; calyxes pubescent. C. G. Native of New Holland. Myrtacea, Sieb. exie. no. 637. Stamens a little longer than the petals.

Sieber's Callistemon. Shrub 4 to 6 feet.

** Filaments of stamens scarlet.

Stiff Callistemon. Fl. May, June. Clt. 1800. Sh. 4 to 8 ft.

11 C. lineatifolium (D. C. l. c.) leaves linear-lanceolate, stiff, mucronate, flat, having the middle nerve finely feather-nerved; the lateral nerves confused with the entire margin of the leaves; tube of calyx villous. C. G. Native of New Holland. Metro. lineatifolia, Link, enum. 2. p. 26. Stamens scarlet.

13 C. marginatum (D. C. prod. 3. p. 224.) leaves lanceolate, stiff, flat, acute at both ends, 3-nerved; the middle nerve rather prominent; and the lateral ones approximating the margin; calyxes glabrous. C. G. Native of New Holland. Metro. marginata, Cuv. n. c. p. 322. Stamens scarlet.

14 C. speciosum (D. C. l. c.) leaves lanceolate, mucronate, flat, having the middle nerve rather prominent, and the lateral ones approximating the margin; calyxes villous; capsule 4-celled, tomentose at the apex. C. G. Native of New South Wales. Metro. speciosa, Sims, bot. mag. p. 1761. Leaves when young rather silky from appressed caducous villi, and reddish. Stamens scarlet.

† A species not sufficiently known.

15 C. hybridum (D. C. l. c.) leaves linear, stiff, mariginate by a nerve, acuminate mucronate, almost pungent, glabrous. C. G. Native country unknown. Metro. hybridus, Otto. hort. berol.

Hybrid Callistemon. Shrub 4 to 6 feet.

 Cult. All the species of CALLISTEMON are worth cultivating in every collection of greenhouse plants for the neatness of their foliage, and the beauty of their blossoms, but especially those belonging to the last division of the genus, for the splendour of their flowers, which are either scarlet or crimson; and are therefore well adapted for a conservatory. The soil best suited for them is a mixture of loam, peat, and sand. Ripened cuttings of them strike root in sand, under a hand-glass. They may be also raised from seeds, which are frequently produced in this country on large plants. Plants raised from cuttings, taken from flowering plants, come into flower when small, but those raised from seeds do not flower till they become large.

XVII. METROSIDEROS (from μπρος, metra, the heart of a tree, and σιδερος, iron; the wood and pith of the trees are very hard). R. Br. gen. rem. p. 15. D. C. prod. 3. p. 224.—Metrosideros species, Gaertn. Smith and Ait.—Nani. Adans. fam. 2. p. 88.

Lin. syr. Leosandra, Monogynia. Tube of calyx not angular, adhering to the ovarium; limb 6-cleft (f. 120. c.). Stamens 20-30, free, very long, and exserted. Style filiform; stigma simple. Capsule 2, but usually 3-celled; cells many-seeded. Seeds wingless.—Trees or shrubs. Leaves opposite or alternate. Flowers pedicellate, not adnate to the branches, as in the genus Melaleuca and Callistemon. The genera Angophora and Callistemon have been separated from Metroseros as it formerly stood; these genera are very natural, but the present genus requires to be still further divided into other genera, for as it now stands it is a heterogeneous mass of plants; but from the fruit of the greater part of the species being unknown, this is altogether impracticable at present.

* Leaves opposite.

1 M. veira (Rumph. amb. 3. p. 16. t. 7. Lindl. coll. t. 15.) leaves opposite, on short petioles, ovate-lanceolate, acuminate, quite glabrous; cymes axillary, pedunculate, many-flowered. C. S. Native of Ambonya and Java, among rocks. Naini Valent. est. ind. 220. t. 53, ex Rumph. Eugenia Ambonyensis, Hort. Flowers yellow. Stamens 30. Ovarium 2-celled. This species differs from all the others in habit, and is probably the only true species of Metroseros. The Chinese make pudders and anchors of the wood; and among the Japanese it is very scarce and valuable. The bark is used as a remedy for flor albus and
diarrhea, being mixed with pinang and a small quantity of cloves and nutmegs.

2 M. diffusa (Smith, in Lin. trans. 3. p. 268.) leaves opposite, ovate, veiny, glabrous on both surfaces; panicles axillary or terminal; pedicels opposite. ɣ. G. Native of New Zealand and the Island of Otaheite. Melaleuca diffusa, Forst. prod. no. 213. Melaleuca lucida, Lin. fil. suppl. t. 342. Flowers yellow. Leaves 3-nerved beneath at the base. Fruit unknown.

**Diffuse Iron-wood.** Tree.

3 M. villosissima (Smith, l. c.) leaves opposite, ovate, veiny, pubescent beneath; thyrse axillary or terminal, opposite, villous; flowers sessile, crowded. ɣ. G. Native of the Sandwich Islands. Flowers reddish. Melaleuca villiosa, Lin. fil. suppl. p. 342. Melaleuca estuosa, Forst. prod. no. 215. Mel. spectabilis, Gaertn. fr. 1. p. 172. t. 34. f. 9.—Leptospermum colhounii, Forst. gen. 36. no. 2. appears to differ from this, according to the description, in the leaves being glabrous on both surfaces, in the petals being velvety, and in the calyx being truncate from the lip being deciduous; it is therefore perhaps a different species.

**Villous Iron-wood.** Tree.

4 M. floridissima (Smith, l. c.) leaves opposite, obovate-oblong, glabrous, veiny; thyrse terminal; calyx turbinate, nakedish. ɣ. G. Native of New Zealand. Melaleuca floridissima, Forst. prod. 114. Leptospermum scandens, Forst. gen. 36. no. 1. but of ɣ. G. Calyx elongated, as in the above, silky from almost imperceptible adpressed down. Flowers yellowish. Stamens twice the length of the petals. Style length of stamens. Ovarium 3-celled.

**Flowering Iron-wood.** Tree.

**Narrow-leaved Iron-wood.** Cilt. 1787. Tr. 20 ft.

7 M. umbellata (Cav. icon. 4. p. 20. t. 337.) leaves opposite, elliptic-lanceolate, glabrous; peduncles umbellate, short, rising from the axils of the upper leaves, rather downy; umbels few-flowered; petals oblong. ɣ. G. Native of New Holland. Melaleuca umbellata, R. ex. Leaves nearly of Phillyrea angustifolia, but differ in being dotted beneath, and revolute at the margins. Lobes of calyx 5, acute, and are as well as the tube glabrous at length. Stamens distinct, much exerted, scarlet. Capsule 3-celled.

**Umbellate-flowered Iron-wood.** Shrub 8 to 10 feet.

8 M. operculata (Labill. sert. cal. p. 61. t. 60.) leaves opposite, linear-lanceolate, glabrous, but when young rather villous; corollas nearly terminal; petals orbicular, somewhat adhering to each other at the apex, and separating in the manner of an operculum. ɣ. G. Native of New Caledonia. Petals opening almost as in Ptilia. Stamens about 70, 5-times the length of the petals. Capsule 5-celled.

**Operculate-petal Iron-wood.** Shrub 9 feet.

9 M. obovata (Hook, in Beech. bot. p. 63. t. 12.) leaves opposite, obovate, coriaceous, very blunt, veiny, glabrous, tapering into the pedicle, which is short, with the margins rather revolute; corollas axillary and terminal; calyx glabrous, full of elevated dots. ɣ. G. Native of Gambier Island.

**Obovate-leaved Iron-wood.** Tree.

10 M. polypermophora (Gaud. in Freyc. Vog. part. bot. p. 482. t. 108. and 109.) leaves opposite, of various forms, coriaceous, glabrous on both surfaces, but covered with a little silky tomentum beneath; pedicels 3 or many-flowered, terminal and axillary, corimbous; calyxes and branches glabrous, or clothed with silky tomentum. ɣ. G. Native of the Sandwich Islands, at the elevation of 900 to 1800 feet.

Var. a.; leaves roundish-elliptic, coriaceous.

Var. b.; leaves ovate or ovate-elliptic, rounded at the base.

Var. γ.; leaves oblong, acute at the base.

Var. δ.; leaves lanceolate.

**Polymorphous Iron-wood.** Tree.

* * Leaves alternate.

11 M. ciliata (Smith, l. c. Labill. sert. cal. p. 60. t. 59.) leaves scattered or nearly opposite, elliptic, obtuse, coriaceous, ciliated at the base when young, as well as the branches; flowers in dense corymbs. ɣ. G. Native of New Caledonia. Melaleuca ciliata, Forst. prod. p. 217. Leptospermum ciliatum, Forst. gen. 36. no. 3. Leaves like those of Celastrus b usifolius. Flowers purple. Lobes of calyx 5, acute, permanent. Capsule 3-celled.

**Ciliated-leaved Iron-wood.** Shrub 6 feet.

12 M. capitata (Smith, l. c.) leaves scattered, obovate, mucronate; heads of flowers dense, terminal; calyxes and branches pilose. ɣ. G. Native of New Holland. Melaleuca ciliata, Sieb. pl. exs. nov. holl. no. 322. Callistemon or Callistemma capitatum, Rchb. hort. bot. 1. t. 84. Leaves 3-4 lines long, rather villous when young, but in the adult state the margins are scabrous from glands. Heads of flowers globose. Flowers lilac. Stamens a little longer than the petals. Stigma rather capitata.

**Capitate-flowered Iron-wood.** Cilt. 1824. Sh. 5 to 6 ft.

13 M. ericifolia (Smith, in Rees’ cyc. vol. 23. no. 16.) leaves alternate, imbricate, linear, acute, pilose, channelled above, convex beneath; heads of flowers terminal. ɣ. G. Native of New Holland, at King George’s Sound. Said to be allied to the preceding species.

**Heath-bearing Iron-wood.** Shrub.

14 M. coriifolia (Vent. malm. t. 46.) leaves alternate, linear, recurved at the apex; flowers axillary; calyxes smoothish, with the lobes lanceolate; stigma capitate. ɣ. G. Native of New Holland, on the eastern coast. Leptospermum microphyllum, Smith, exot. bot. t. 59. Flowers white. Leaves crowded on the branches. Stamens a little longer than the petals. From the stigma being capitate (f. 120. b.) in this as well as in M. capitata and M. ericifolia, these plants will form a distinct genus, which might be called Gymnacéphala.

**Coriaceous-leaved Iron-wood.** Shrub 4 to 6 feet.

**Juniper-like Metrosideros.** Shrub 4 to 6 feet.
MYRTACEÆ. XVII. METROSIDEROS. XVIII. LEPTOSPERMUM.

16 M. pu' ' s e n s (Sieb. ex Spreng. syst. add. p. 194.) leaves linear, mucronate, spreading, nerv'd, glabrous; pedicels woolly; spikes capitate. " G. Native of New Holland. Pongent Metrosideros. Shrub.

† Species not sufficiently known.

* Leaves and flowers unknown.

17 M. ? s a l i c e f ó l i a (Gaertn. fruct. 1. p. 171. f. 3.). Two species of Encaliptus are confused under this name. Willow-leaved Iron-wood. Tree.

18 M. ? c a l y c e f ó l i a (Gaertn. fruct. 1. p. 172. t. 94. f. 8.). This is a species of Leptospermum. Tall Iron-wood. Tree.

19 M. ? s p e c t a b i l i s (Gaertn. l. c. f. 9.). Probably a species of Leptospermum. Shiny Iron-wood. Shrub.

20 M. ? s c á n d e n s (Gaertn. l. c. f. 10.). Probably a species of Leptospermum. Climbing Iron-wood. Shrub.

21 M. ? a l b i f ó r a (Gaertn. l. c. f. 11.). Probably a species of Leptospermum. White-flowered Metrosideros. Shrub.

22 M. ? s p e c t a b i l i s (Gaertn. l. c. f. 12.). Probably a species of Leptospermum. Myrtle-leaved Iron-wood. Shrub.

* * * Flowers and fruit unknown.

23 M. ? a r o m a t i c a (Salisb. prod. p. 351.) leaves alternate, broad-ovate, acuminate, thin, glaucous beneath. " G. Native of Port Jackson. Aromatic Iron-wood. Shrub.

24 M. ? p r o c e r a (Salisb. l. c.) leaves alternate, ovate-lanceolate, green beneath, coriaceous, with divaricating nerves. " G. Native of Port Jackson. Tall Iron-wood. Tree.

25 M. ? p r o t i n a u a (Salisb. l. c.) leaves alternate, ovate-lanceolate, glaucous beneath, coriaceous, with divaricating nerves. " G. Native of Port Jackson. Allied Iron-wood. Shrub.

27 M. ? c o r i a c e a (Salisb. l. c.) leaves alternate, ovate-lanceolate, glabrous on both surfaces, very coriaceous. " G. Native of Port Jackson. Coriaceous-leaved Iron-wood. Shrub.

28 M. ? d e c o r a (Salisb. l. c.) leaves alternate, dense, on very short petioles, lanceolate, mucronulate, coriaceous, glabrous on both surfaces in the adult state. " G. Native of Port Jackson. Neat Iron-wood. Shrub.

29 M. ? s c a r i o s a (Horn. hort. hafn. suppl. p. 139.) leaves scattered, lanceolate, with scarious margins; branchlets pubescent. " G. Native country unknown. Scariosa-leaved Iron-wood. Shrub.

** ** Species entirely undescribed.

30 M. c o n n a t a, Desf. hort. par. 31 M. p l i n i e f ó l i a, Desf. l. c. 32 M. n a n a, Gmel. hort. Carls. N.B. Metrosideros macrophylla of Lam. ill. t. 421. f. 1. Poir. suppl. 3. p. 686 is the same as Sarcole'a n a m u l t i f ó l i a, see vol. 1. p. 562. as a nearly allied species.

Cult. For culture and propagation see Callistemon, p. 823.

2 L. o v o b a t e m (Sweet, fl. aust. t. 36.) leaves obovate, emarginate, obscurely 3-5-nerved, glabrous; branches angular, a little winged; calyxes glabrous; with the teeth coloured. " G. Native of New Holland. Flowers white.

3 L. s p e r m e c u m (Labill. nov. holl. 2. p. 2. t. 147.) leaves obovate, mucronate, 3-5-nerved, silky on both surfaces as well as the calyxes; lobes of calyx permanent. " G. Native of Van Diemen's Land. Flowers white.

4 L. t u b e r c u l a t u m (Poir. suppl. 3. p. 338.) leaves ovate or oblong-lanceolate, dotted beneath and finely 3-nerved, glabrous in the adult state, but clothed with silky pubescence when young, as well as the branchlets; calyxes silky, but when in fruit glabrous. " G. Native of New Holland, about Port Jackson. L. stellatum, Cav. icon. 4. p. 16. t. 330. The margin of the calyx is said to be entire by Cavanilles, in his diagnosis, but from his description, as well as from the figure, it is acutely 5-cleft. The petals are yellow, according to Cav., but according to the specimen white.

Var. β, s ub e n é r é e (D. C. prod. 3. p. 227.) leaves 1-nerved, or almost nerveless.

5 L. g r a n d i f l o r u m (Smith, in Lin. trans. 6. p. 299.) leaves lanceolate, narrowed at both ends, mucronate; calyxes villous, with coloured teeth; bracteas glaucous, permanent. " G. Native of New Holland. Sims, bot. mag. t. 1810. Lodd. bot. cab. t. 701. Flowers large, white, about the size of those of Fabricia leavigata. Leaves pubescent when young, but glabrous in the adult state.

6 L. l a n i c u r u s (Ait. hort. kew. ed. 2. vol. 3. p. 182. but not of Willd.) leaves oblong or oval, mucronate, pubescent on both surfaces or only beneath, obsoletely 3-nerved; branchlets villous; calyxes very villous, from spreading pili. " G. Native of Van Diemen's Land and New Holland. Lodd. bot. cab. t. 1192. Philadelphus läniger, Ait. hort. kew. ed. 1. vol. 2. p. 156. Flowers white.

Var. β, p u b é c e n s (D. C. prod. 3. p. 227.) leaves smaller, and rather oblique. " G. Gathered with the species. Philadelphus läniger β, piliger. Ait. hort. kew. ed. 1. vol. 2. p. 156. L. pubéens, Willd. spec. 2. p. 650. Not differing from the species, unless in the leaves being rather smaller. Both have their leaves sometimes nearly glabrous in the gardens; but always to be known by the hairy calyx.

5 N

Three-nerved-leaved Leptospermum. Shrub 4 to 6 ft.

8 L. scoparium (Smith, in Lin. trans. 3. p. 282.) leaves ovate, mucronate, obliquely 3-nerved; calyxes glabrous; calyceate teeth membranous, coloured. G. Native of New Zealand and New Holland, on the sea-shore. Andr. bot. rep. 622. Philadelphus scoparius, Ait. hort. kew. ed. 1. vol. 2. p. 150. Melaleuca scoparia, Wendl. sert. hnn. p. 25. t. 15. Flowers white. The leaves of this species were used by Captain Cook's ships' crews as tea, whence they named it the tea-plant. They have a very agreeable bitter flavour, with a pleasant smell when fresh, but lose something of both when dry. A strong infusion of them proved emetic to some, in the same manner as green tea. They were also used with spruce leaves in equal quantity to correct their astrigency, in brewing beer from them and they rendered the beer exceedingly palatable. Var. a. bifidum (D. C. prod. 3. p. 227.) leaves lanceolate. G. Native of New Zealand. L. scoparium, Forst. gen. 36. trav. 1. t. 22. Melaleuca scoparia dioximatifolia, Wendl. l. c. f. 1. L. squarrosum, Gourn. fruct. 1. p. 174.

Var. b. muticum (D. C. l. c.) leaves ovate-eliptic. G. Native of New Holland. Wendl. l. c. f. 2. Philadelphus floribundus, Rehm. et Ut. mag. 7. t. 2.

9 L. flavescens (Smith, l. c. Ait. hort. kew. cd. 2. vol. 3. p. 181.) leaves lanceolate, obtuse, 1-nerved, dotted; calyxes glabrous; calyceate teeth membranous, at length deciduous. G. Native of New Holland. L. thea, Willd. L. flavescens, Willd. spec. 2. p. 949. Hook, bot. mag. 2695. Melaleuca thea, Wendl. sert. hnn. 1. p. 25. t. 14. L. polyga-lefollium, Salisb. prod. 3. Flowers white, but yellowish in a dried state. Wendland says the leaves are 3-nerved, and in the Hortus Kewensis they are said to be nerveless, but in the specimens examined they are 1-nerved, as in the figure of Wendland. Yellow-leaved Leptospermum. Fl. May, July. Clr. 1788. Sh. 4 to 6 feet.

10 L. gnidifolium (D. C. prod. 3. p. 228.) leaves linear-lanceolate, acutish, 3-nerved, dotted; calyxes covered with silky villi; calyceate teeth smoothish, and coloured a little. G. Native of New Holland. L. pendulum, Sieb. Flowers white.

Gnidia-leaved Leptospermum. Shrub 4 to 6 feet.

11 L. porophyllum (Cav. icon. 4. p. 17. t. 280. f. 2.) leaves oblong-lanceolate, acutish, 1-nerved, densely dotted, glabrous; calyxes silky, with the teeth acute. G. Native of New Holland. In the figure of this plant, given by Cavanilles, the teeth of the calyx are deciduous, and the pubescence of the calyx is not taken any notice of, but it is probably the same. Flowers white.

12 L. parvifolium (Smith, in Lin. trans. 3. p. 282.) leaves oblong-obovate, nerveless, dotted, glabrous; calyxes villous, with the teeth membranous and coloured. G. Native of New Holland. L. arachnoidea, Sieb. pl. excis. nov. holl. no. 313. Branches villous when young, but at length becoming glabrous. Leaves 2 lines long. Flowers white.

13 L. myrtifolium (Sieb. pl. excis. nov. holl. no. 314.) leaves obovate-oblong, 3-nerved, dotted, rather pubescent while young; calyxes clothed with silky villi; with the lobes membranous, coloured, and pubescent. G. Native of New Holland. Flowers solitary, sessile, yellowish when in a dry state.

Myrtle-leaved Leptospermum. Shrub 3 to 6 feet.

15 L. multiflorum (Cav. icon. 4. p. 17. t. 331. f. 1.) leaves linear, attenuated, acuminate, 1-nerved, dotless; calyxes glabrous, with the lobes deciduous. G. Native of New Holland. Flowers white.

Many-flowered Leptospermum. Shrub 6 to 8 feet.

16 L. thyrsifolium (Cunning. in Field's new south wales, p. 319.) rather villous; leaves oval, obtuse, flattish; flowers axillary, solitary, or twin; segments of the calyx deciduous. G. Native of New Holland, growing in swampy forest land on the Macarrie River.

17 L. multicaule (Cunning. l. c.) silky; leaves oval, or ovate-lanceolate; teeth of calyx coloured. G. Native of New Holland, in barren bushy hills, near Bathurst.

Many-stemmed Leptospermum. Clr.? Shrub.

18 L. obliquus (Coll. hort. ripul. append. 2. p. 551.) leaves oblique, sessile, linear-lanceolate, attenuated at the base, and mucronate at the apex, dotted, pale beneath; stems reddish, branched. G. Native of New Holland. Nearly allied to L. multiflorum. Flowers white.

20 L. baccaum (Smith, l. c.) leaves linear-lanceolate, pungent, 1-nerved, but 3-nerved at the very base; branches hairy; calyxes glabrous: with coloured, pubescent teeth; capsule bacate. G. Native of New Holland. L. juniperifolium, Cav. icon. 4. p. 18. t. 331. f. 2. Flowers white.

Cobwebbed Leptospermum. Fl. May, Jul. Clr. 1795. Sh. 2 to 3 feet.

22 L. triloculare (Vent. malm. t. 84.) leaves linear, pungent, dotted, ciliated; calyx clothed with silky villi, both on tube and teeth; capsule 3-5-celled; stamens 15. G. Native of New Holland. Lodd. bot. cab. t. 791. Bracteas gencmaceous, permanent, glabrous. Leaves usually twisted oblquely, 1-nerved, hardly 3-nerved at the base. Flowers white.

MYRTACEE. XVIII. LEPTOSPERMUM. XIX. BILLOTIA. XX. FABRICA. XXI. BÆCKEA.

23 L. du bium (Spreng. syst. 2. p. 492.) leaves linear, very narrow, bluntish; teeth of calyx glabrous, green.  G. Native of New Holland. The rest unknown.

Doubtful Leptospermum. Shrub.

24 L. februm (Sieb. pl. excis. nov. holl. no. 312.) leaves linear, acute, when young silky, but glabrous in the adult state, dotted, 1-nerved; calyx clothed with silky villi, both on the tube and lobes.  G. Native of New Holland. Branches twiggy, flexible, glabrous.

25 L. squarrosum (Sieb. pl. excis. nov. holl. ex Spreng. syst. addend. p. 194.) leaves lanceolate, acute, squarrose, stiff, glabrous, but when young silky beneath; calyx sessile, glabrous, coloured, obtuse.  G. Native of New Holland.

Squarrosum Leptospermum. Shrub 4 to 6 ft.

26 L. ericocalyx (Sieb. pl. excis. nov. holl. ex Spreng. syst. add.) leaves small, spatulate, quite glabrous, dotted; calyxes nearly sessile, clothed with silky wool.  G. Native of New Holland.

Hairy-calyx Leptospermum. Shrub 4 to 6 ft.

† Species not sufficiently known.

27 L. ? umbellatum (Gærtn. fruct. 1. p. 174. t. 35. f. 3.) flowers umbellate; capsule girded by a circular margin in the middle.  G. Native of New Holland. Perhaps this plant does not belong to the present genus, but it is not sufficiently known.

Umbellate flowered Leptospermum. Shrub.

29 L. Ambineense (D. C. prod. 3. p. 229.) leaves linear-lanceolate; flowers pedicellate, solitary; calyceal lobes deciduous.  S. Native of Amboyna. Myrtus Ambineensis, Randph. amb. 2. t. 18. Perhaps a species of Bæcke'a, but the leaves are said to be scattered, and the stamens 23 in number.

Ambyna Leptospermum. Shrub.

Cult. For culture and propagation see Callistemon, p. 823. All the species are pretty shrubs when in flower.

2 F. LEVIOATA (Gærtn. l. c.) cells of capsule 5-8-seeded; calyceal teeth triangular; leaves glabrous when young.  G. Native of New Holland, about Port Jackson.

3 F. stricata (Lodd. bot. cab. t. 1213.) the figure and description of this plant are so insufficient, as not to admit of us giving a description of it; and the plant is now lost in the gardens.  G. Native of New Holland.

Straight Fabricia. Fl. April, Ju. Clt. 1827. Sh. 2 to 4 ft.

Cult. The species of Fabricia are well fitted for a conservatory, as they do not flower until they have attained a considerable size. A mixture of loam and peat is the best soil for them. Cuttings taken from young wood root readily, if planted in a pot of sand, with a bell-glass placed over them.

Lin. syst. Pentadecandra, Monogynia. Tube of calyx turbinate; limb 5-cleft, permanent. Petals 5. Stamens 5-10, shorter than the petals. Style filiform; stigma capitate. Capsule 2-5-celled, many-seeded, inclosed in the calyx.—Shrubs, with opposite, glabrous, dotted leaves. Flowers pedicellate, small, white. In B. virgata the filaments are glandular at the tops and probably in the others.

1 B. FRUTESCENS (Lin. spec. p. 514.) leaves linear, awnless; pedicels axillary, 1-flowered; calyceal teeth membranous, coloured.  G. Native of China. Osbeck, trav. p. 251. t. 1. 5 n 2

SHRUBBY BEECHEA. FL. SEPT. OCT. D. C. PROD. 5. P. 229.) LEAVES ELLIPTIC-OBVATE, OBLIQUE, RATHER CURVED, ACUTISH, ACUTE, CROWDED, IMBRICATED, SOLITARY, APPROXIMATE, SELLACEOUS. B. G. NATIVE OF NEW HOLLAND. MYRTACEÆ. SEB. PL. EXCIS. NOV. HOLL. NO. 583.

Diosma-like BEECHEA. FL. AUG. OCT. D. C. PROD. 5. P. 230. CALYX 4-5-CELFT. PETALS 4-5. STAMENS FREE. FRUIT FLEShy, MANY-CELLED.—TREES AND SHRUBS, FOR THE MOST PART NATIVES WITHIN THE TROPICS, AND A VERY FEW OF NEW HOLLAND.

TRIBE III.

The leaves are opposite and full of pellucid dots, or opaque, quite entire. The peduncles are axillary, sometimes 1-flowered, sometimes bearing trichotomous cymes, and sometimes branched, and approximating into a terminal panicle.

XXII. SONNERATIA (so named by the younger Linnaeus in memory of M. Sonnerat, who travelled into New Guinea, the East Indies, and China, and communicated many plants to the botanists of Europe; author of Voyage a la Nouvelle Guinée, Paris, 1776. 4to., Voyage aux Indes Orientales, & à la Chine, 1774-1781. Paris, 1782. 4to.) Lin. fil. suppl. p. 28. Juss. gen. no. 92. Calyx campanulate, 4-6-cleft, adhering to the ovary at the base; lobes acute, valvate in situolation. Petals 4-6, spreading, alternating with the lobes of the calyx, or wanting. Stamens numerous; filaments free; anthers roundish. Style filiform; stigma subcapitate. Base of berry adnate to the permanent calyx, but free at the apex, and appearing semi-superior, nearly globose, many-celled; rind membranous; cells 10-15, separated by thin dissepiments. Seeds numerous, nesting in fleshy pulp, curved, exalbiminous. Embryo curved, with a long radicle, and foliaceous, short, convolute, unequal cotyledons. Small trees, with terminal branchlets. Leaves opposite, entire, oval, thickish, 1-nerved, nearly veinless, without any dots. Flowers terminal, nearly solitary, large.

Acid-fruited Sonnerata. Tree 40 ft.

2 S. ALBA (Smith in Rees’ cyc. vol. 33. no. 24.) branchlets terete; leaves oval-roundish; flowers 6-8-cleft, apetalous; berry obconical at the base, and depressed at the apex. G. Native of the Moluccas. Mangium cascalorís ábund, Ramph. amb. 3. t. 74. White Sonnerata. Tree 50 ft.

3 S. apETALa (Butchan in Sym. emb. avs. 3. p. 318. t. 25. ex Smith in Rees’ cyc. vol. 33. no. 3.) branchlets terete, pendulous; leaves ovate-lanceolate; flowers 4-cleft, apetalous. G. Native of Aya near Rangoon, on the wet inundated banks of the coast. Roth, nov. spec. p. 233. Apetalus Sonnerata. Tree.

Cult. For culture and propagation see Psidium, p. 833.

XXIII. NEILITRIS (from υαι, ne, priv. and κλωπος, κλητον, a seed- vessel; in reference to the berry, which is without any partitions). Gært. fruct. 1. p. 134. t. 27. Lindl. coll. no. 16, in a note. D. C. prod. 3. p. 231.—Decapspermum, Forst. gen. no. 37.—Psidium species, Lin. fil.

LIN. SYST. lecostmédia, Monogynía. Tube of calyx globose; limb 5-parted; lobes ovate. Petals 5. Stamens numerous, free, inserted in a narrow ring at the base of the limb of the calyx. Style filiform; stigma peltately capitate. Berry many-seeded, pulpy, globose, crowned by the calyx, 10-12-seeded (Ruiz et Pav.), 7-10-seeded; cells containing about 9 seeds. Seeds 10-12, imbedded in pulp, disposed in one circular series, inserted in a large fleshy placenta, ex Kuhnh., somewhat reniform, ex Ruiz et Pav.; testa granular and resiniferous.—American trees.

Leaves opposite, petiolate, conduplicate, entire, full of pellucid dots. Peduncles one or many-flowered, rising from the axils of the fallen leaves. Berry crowned by the calyx.

1 C. lineatifólia (Ruiz et Pav. syst. 128. fl. per. ined. 4. t. 422.) leaves oval, acute; pedicels axillary, aggregate, bibracteolate. G. Native of the Andes of Peru, in very hot places. It is also cultivated in the gardens of Peru, under the name of Patillo, for the sake of its fruit, which are eaten by the inhabitants, and has much the taste of the Guava. The fruit is yellow and sweet-scented. Lined-leaved Campanoesia. Tree.

2 C. cornifólia (H. B. et Kuhnt, nov. gen. amer. 6. p. 150. D. C. prod. 3. p. 232.) leaves nearly elliptic, acute, clothed with fine pubescence beneath; lower peduncles aggregate or branched. G. Native of New Granada, near Ibagué, where it is called Guayavo de Anselmo, and where the fruit is eaten by the inhabitants. Perhaps the same as the preceding species.
MYRTACEÆ.

XXV. Psidium. (From ψίδιον, psidion, the Greek name of the pomegranate. It is derived from ψίδον, pison, to make small, in reference to the number of seeds.) Lin. gen. no. 615. Lam. ill. 416. Lindl. coll. no. 16.—Guadávía, Tourn. inst. t. 448. Garr.-fruct. 1. p. 185. t. 38.—Psidium and Buchardía, Neck.

L. Syst. Icosandra, Monogyóia. Tube of calyx elliptoid (f. 121. a.) or obovate, usually contracted at the apex; limb ovate, undivided, but afterwards 1-5-cleft (f. 121. d.). Petals 5 (f. 121. b.). Stamens numerous, free, inserted in a broad circle almost through the whole undivided part of the limb. Style filiform (f. 121. c.); stigma capitate. Ovarium 5-20-celled (f. 121. c.) (ex Mart. in litt.); cells bipartite; from the septicum placenta being cleft at the margin, many of the cells become abortive at maturity. Ovula numerous, horizontal (f. 121. c.), fixed to the margin of the placenta. Berry many-seeded, corticate by the tube of the calyx, and crowned by its lobes. Seeds nesting in the pulp in the mature fruit, with a bony testa. Embryo form of a horse-shoe, with a hard crustaceous testa; radicle longer than the cotyledons, which are very small; cover of embryo separable at the radicle.—Trees or shrubs, natives of America within the tropics. Leaves opposite, feather-nerved, dotted. Pedunules axillary, 1-3-flowered, bracteate. Flowers white. Fruit edible; cells usually not distinguishable at maturity. Guavá is a corruption of the American name Guayaba.

* Branchlets tetragonal.

1 P. Fúmíle (Vahl. symb. 2. p. 56.) branchlets tetragonal; leaves lanceolate, acute, glabrous above, tumescent and lined beneath; pedicles 1-flowered, shorter than the leaves; fruit globose. "S. Native of the Moluccas, Ceylon, and Java. Blume, bijdr. fl. ned. ind. p. 1093.—Rumph. amb. 1. t. 49. P. angustifolium, Lam. dict. 3. p. 16. Branches and under side of leaves white, ex Lam. P. cujavis, Burm. fl. ind. p. 114, but the peduncles are said to be 2-flowered, and the leaves ovate.

Var. β, Guadalupeíense (D. C. prod. 3. p. 233.) leaves linear-lanceolate, velvety from rufous down beneath, as well as on the branchlets. "S. Native of Guadaloupe. Perhaps the same as the Indian plant.

 Dwarf Guava. Shrub 2 to 3 ft.

2 P. aromático (Aubl. guian. 1. p. 485. t. 191.) branchlets tetragonal; leaves oblong, acuminate, glabrous; peduncles 1-flowered; fruit globose, 4-celled. "S. Native of the woods of Guiana and Cayenne. Buchardía, Neck. gen. no. 728. Berry yellow, hardly the size of a cherry. The bruised leaves have the smell of balm.

Var. β, grandiflórum (Aubl. guian. t. 190.) leaves ovate. "S. Native along with the first, which it very like, but smaller.

3 P. actuángulúm (D. C. prod. 3. p. 235.) branchlets acutely tetragonal, almost 4-Winged, glabrous; leaves ovate or oblong, short, petiolate, rather attenuated at both ends, glabrous, full of peculiar and somewhat tubercular dots; pedicels solitary, 1-flowered; calyx lobes ovate, reflexed, longer than the tube, which is obovate before expansion. "S. Native of Brazil, near Ega. Pedicels nearly an inch long. Leaves about 3 inches long.

Var. β, acídum (Mart. herb.) leaves more obtuse at the base, hardly with any pellucid dots. "S. Native of Brazil, at Nogueira, in the province of Rio Negro. Fruit globose, glabrous, pale yellow, size of a Borsoloffé apple. Lobes of calyx ovate, obtuse, erect, and usually connate, coronaing the fruit: pulp acid, citron-coloured. Seeds orbicular, compressed, pale brown.

Acute-angled-branched Guava. Shrub.

4 P. striátüleó (D. C. prod. 3. p. 233.) branchlets tetragonal, glabrous; leaves oblong, gradually acuminate, hardly obtuse at the base, on very short petioles, glabrous, and full of tubercular dots on both surfaces; pedicels solitary, 1-flowered, glabrous; ovarium obovate, striated lengthwise. "S. Native of Brazil. Allied to P. turbiníferum. Leaves with pellucid dots when young. Perhaps a species of Myrtest.

Striated-branched Guava. Shrub 10 to 12 ft.

5 P. punctulátum (D. C. l. c.) branches somewhat tetragonal; leaves ovate, cuneate at the base, short-acuminate at the apex, glabrous, dotted beneath, and bearded in the axis of the veins; pedicels 1-flowered; ovarium round, globose. "S. Native of Brazil. Petioles half an inch long. Pedicelles longer than the pedicels. Young leaves villous and dotted. Lobes of calyx broad, very blunt, and spreading. Perhaps a Myrtest. Dotted Guava. Shrub 4 to 6 ft.

6 P. rivuláce (Mart. herb. ex D. C. l. c.) branchlets somewhat tetragonal; leaves oval or ovate, short-acuminate, glabrous above, when young white beneath, clothed with rufous down at the nerves, but glabrous in the adult state; pedicels solitary, 1-flowered, opposite, at the base of the branchlets of the same year; fruit spherical. "S. Native of Brazil, between Coari and Ega by rivulet sides. Lobes of calyx oval, obtuse. Fruit 10-celled.

Rivulet Guava. Shrub 6 to 10 ft.

7 P. Maríbeíense (Mart. herb. D. C. prod. 3. p. 233.) glabrous; upper part of branches tetragonal; leaves on short petioles, elliptic-oblong, cuneate at the base, bluntish at the apex; pedicels 1-flowered, a little longer than the petioles; fruit spherical. "S. Native of Brazil, at Maribí, near the river Tapará. Leaves 2 inches long, and an inch broad. Petioles 2 lines long. Fruit 6 lines in diameter. Lobes of calyx short, at length obliterated or deciduous.

Maribí Guava. Shrub 6 to 10 ft.

8 P. montánum (Swartz, fl. ind. occ. p. 879.) branches tetragonal; leaves oval-oblong, acuminate, quite glabrous; peduncles many-flowered; fruit roundish. "S. Native of Jamaica, on the mountains. Wood very hard. Fruit small, acid, smelling like the flowers of the bitter-almond; hence it is called Almandron. Leaves broadly suberubent according to the author, but almost entire according to the speciens examined. The wood is excellent, of a dark-colour and curved grain; it is easily worked, and makes a fine polish.

Mountain Guava. Clt. 1779. Tree 60 to 100 ft.

9 P. ríferum (Lin. spec. 672.) branches tetragonal; leaves elliptic, acute, lined with rather prominent nerves, pubescent beneath; pedicels 1-flowered; fruit pear-shaped. "S. Native of the Caribbean Islands and the continent of America, near Cumaná, and now cultivated every where within the tropics, for the sake of its fruit. Lindl. bot. reg. 1079. Ruiz et Pav. fl. per. ined. 4. t. 418. Rumph. amb. 1. t. 47. Trew. ebr. t. 43. Guayávra pyriformis, Garrn.-fruct. 1. t. 38. P. vulgaré, Rich. act. soc. hist. par. p. 110. The common Guava is pear-shaped, and of a yellowish colour when ripe. Pulp sweet, aromatic, and pleasant. The fruit of the guava is eaten both by the natives and Europeans, either in its crude state or when made into jellies.

Tree 10 to 20 ft.

10 P. rómitére (Lin. spec. p. 672.) branches tetragonal;
leaves oval or oblong-lanceolate, pubescent beneath; peduncles 3-8, or many-flowered; fruit globose. \( \text{H. S.} \) Native of the West Indies, Mexico, and South America, from whence it has migrated to the East Indies, but is said to grow wild in Cochin-china, by Loureiro. Perhaps indigenous to both Asia and America, or probably two species are confused. Rumph. amb. 1. t. 48.—Mer. sur. t. 57. Hern. mex. p. 85. with a figure. Fruit yellow, somewhat astrigent, with an agreeable odour. The root and young leaves are astrigent, and are esteemed useful in strengthening the stomach. Peduncles downy, varying from one to many-flowered, whence it has been joined with \( P. \) pyrifera by Raddi, under the name of \( P. \) Guatiana. Pulp of fruit red.

**Var. \( \text{b.} \) sapidissima** (Jacq. Hort. Scherb. 3. p. 62. t. 366.) peduncles 1-flowered.—Native country unknown. Berry dirty yellow, larger than a plum.

11 P. \( \text{m.} \) laxa (Mart. herb. D. C. prod. 3. p. 234.) branches tetragonal; leaves oval, obtuse at the base, and usually at the apex, puberulous on both surfaces, but hairy on the nerves beneath; peduncles solitary, 1, rarely 2-flowered, axillary, erect, lateral ones usually deflexed; flower-bud globose, gaping at the apex. \( \text{H. S.} \) Native of Brazil, at Vaado, Parama, in Tabuleira, and Catingas. Branches, peduncles, and calyxes velvety from short rufous down. Ovarium obovate. Limb of calyx cup-shaped; lobes 5, roundish, at length reflexed.

*Gaping Guava.* Shrub 6 to 10 ft.

12 P. \( \text{b.} \) turbiniflorum (Mart. in litt. ex D. C. 3. p. 234.) branches tetragonal, hairy; leaves ovate-oblong, gradually acuminate, oblong at the base, on very short petioles, bent with tabicular dots on both surfaces, and hairy on the nerves beneath; pedicels 1-flowered, solitary, villous; calyx gaping, at length lobed; ovarium oblong, turbinat. \( \text{H. S.} \) Native of Brazil. Pedicels 9-10 lines long. Ovarium and calyx becoming glabrous at length. Branches opposite, at length terete.

*Top-flowered Guava.* Shrub 10 to 20 ft.

13 P. \( \text{c.} \) cereum (Mart. herb. ex D. C. l. c.) branches tetragonal; leaves oblong, mucronate, on very short petioles, glabrous above, but clothed with adpressed canescent villi beneath; peduncles 1-3-flowered; fruit ovate, crowned by the lobes of the calyx, which are roundish-ovate and short. \( \text{H. S.} \) Native of Brazil, in the province of St. Paul. Perhaps a narrow-leaved variety of \( P. \) incanescens.

*Grey Guava.* Shrub 4 to 6 ft.

14 P. \( \text{incanescens} \) (Mart. herb. ex D. C. l. c.) branches tetragonal; leaves ovate, on short petioles, cuneated at the base, obtuse, and mucronate at the apex, glabrous above, but clothed with adpressed canescent villi beneath; peduncles 1-3-flowered; young fruit ovate, crowned by the lobes of the calyx, which are ovate and short. \( \text{H. S.} \) Native of Brazil, in fields near Taubate, in the province of St. Paul. A very distinct species. Branchlets rather downy. Leaves 2½ inches long, and ½ broad. Fruit nearly like that of Eugenia, 4-5-seeded.

*Hoary Guava.* Shrub 4 to 6 ft.

15 P. \( \text{granifolium} \) (Mart. herb. ex D. C. l. c.) branches tetragonal, thick, clothed with white tomentum; leaves obovate, mucronate, on short petioles, cuneated at the base, glabrous above, but clothed with white tomentum beneath; peduncles 1-flowered; fruit globose, nearly naked. \( \text{H. S.} \) Native of Brazil, in fields at Ypanema, in the province of St. Paul. Like \( P. \) incanescens, but the down is more woolly. Leaves 5 inches long. Stem 1-3 feet high. Root thick. Fruit about the size of a walnut. Perhaps the same as \( P. \) grandiflorum, Ruiz et Pav. fl. per. ined. 4. t. 421. f. a.

*Great-flowered Guava.* Shrub 1 to 3 ft.

16 P. \( \text{rufum} \) (Mart. herb. ex D. C. l. c.) branches tetragonal, densely clothed with rufous hairs, as well as the peduncles, bracteas, and calyces; leaves elliptic or elliptic-oblong, on short petioles, villous on both surfaces when young, but in the adult state glabrous on the upper surface, and clothed with rufescent villi beneath; pedicels in the axils of the lower branchlets, but somewhat racemose; young fruit ovate-roundish, crowned by the lobes of the calyx, which are short and obtuse. \( \text{H. S.} \) Native of Brazil, in mountain fields in the province of Minas Geraes. Branchlets hairy, but the branches are terete and smooth. Leaves 4 inches long, and 1½ to 2 inches broad. Branchlets linear.

*Ruiz's Guava.* Shrub 4 to 6 ft.

17 P. \( \text{pubescens} \) (Mart. herb. ex D. C. l. c.) branches rather tetragonal; pedicels, bracteas, and calyces hairy; leaves nearly sessile, oblong, acute, when young downy on both surfaces, hoary beneath; pedicels 1-flowered; bracteoles linear-subulate; lobes of calyx acute. \( \text{H. S.} \) Native of Brazil, in the province of Pernambuco, near the river Termo. Flowers large. Ovarium broadly obovate, not constricted at the apex. Habit nearly of Crategus eriocarpa.

*Pubescent Guava.* Shrub 5 to 4 ft.

**Branchlets terete.**

18 P. \( \text{guineense} \) (Swartz, fl. ind. occ. 2. p. 881.) branches terete, pubescently villous; leaves petiolate, ovate, glabrous above, clothed with rusty tomentum beneath, as well as the petals; peduncles 1-3-flowered; fruit roundish. \( \text{H. S.} \) Cultivated in the West Indies, but is said to have been introduced from Guiana. Berry fulvous, rather pubescent, red inside, but the size of a nutmeg, of an exquisite taste.

*Guinean Guava.* Shrub 8 to 12 ft.

19 P. \( \text{polyderont} \) (Lamb. in Lin. trans. 11. p. 231. t. 17.) branches terete, hairy; leaves almost sessile, oval-oblong, acute, pubescent above, wrinkled and sebaceous beneath; peduncles 3-flowered; fruit globose. \( \text{H. S.} \) Native of the Island of Trinidad. Ker. bot. reg. 653. Branches reclinate. Fruit yellow inside, about the size of a plum, of a delicate taste. The middle flower on the peduncle is sessile, and the lateral ones pedicellate, as in the preceding and following species.

20 P. \( \text{araca} \) (Raddi, mem. 1821. p. 5. t. 1.) branchets terete, hairy; leaves petiolate, oval or oblong, obtuse, downy or hairy on both surfaces; peduncles axillary, 1-3-flowered; fruit ovoid. \( \text{H. S.} \) Native of Brazil, in fields about Rio Janeiro. P. minus, Mart. herb. Berry about the size of those of a sorbus, greenish-yellow on the outside, but whitish within. Very nearly allied to \( P. \) Guineense, but the leaves are velvety above, not glabrous, and the nerves more elevated.

*Araca Guava.* Shrub 4 to 6 ft.

21 P. \( \text{pluvialale} \) (Rich. ex herb. Thib.) branchets terete, glabrous; leaves petiolate, oval, quite glabrous; lower ones obtuse at both ends; but the upper ones are acuminate at both ends; pedicels opposite, 1-flowered, almost 10-times the length of the pedicels. \( \text{H. S.} \) Native of Cayenne, along the banks of rivers. P. Guianense, Pers. ench. 2. p. 27. Peduncles an inch and a half long. Style longer than the stamens. Stigma hardly
capitate. Fruit unknown. Leaves full of pellucid dots. Perhaps a Myrtus.

**River-side Guava.** Shrub 6 to 8 feet.

23 P. densicormum (Mart. herb. ex D. C. I. c.) branches terete, rather compressed at the apex, glabrous; leaves petiole, ovate-lanceolate, gradually acuminate, glabrous; pedicels 1-flowered, 3 or 4 times longer than the pedicles; fruit globose. **h. S.** Native of Brazil, on the banks of the Solomons, and at Lake Ega. Tree glabrous, with a dense head. Allied to P. floridul., but differs in the pedicels being shorter.

**Dense-headed Guava.** Tree 20 feet.

28 P. littoralis (Raddi, mem. 1851. p. 6. t. 1. f. 2.) branches terete; leaves oval-oblong, thickish or coriaceous, attenuated at the base, bluntly acuminate at the apex, glabrous on both surfaces, shining above; pedicels 1-flowered, longer than the pedicles; fruit exactly pear-shaped. **h. S.** Native of Brazil, on the banks of rivers. Nearly allied to P. turbiniformis. Leaves 3 inches long and an inch broad, with some sinuate crenated margins. Lobes of calyx very blunt.

**River-side Psidium.** Tree 20 to 30 feet.

23 P. guaviroba (D. C. prod. 3. p. 255.) glabrous; branches terete; leaves oval-lanceolate, acuminate, tapering to the base, petiolar, pedicels 1-flowered, length of pedicles; fruit globose; calyceal lobes short and blunt. **h. S.** Native of Brazil, in fields at Ypanema, in the province of St. Paul, where it is called by the inhabitants Guaviroba de Cano or Guaviroba de Campo. P. canina, Mart. herb. but not of Lour. Leaves 2 inches long, and 9-10 lines broad. Fruit the size of a large pea.

*Guaviroba.* Shrub 6 to 10 feet.

28 P. decussatum (D. C. I. c.) branches terete, rather hairy; leaves ovate, obtuse, membranous, opaque; pedicels axillary, 1-flowered, length of leaves; calyx at length 5-lobed, reflexed, style incurved. **h. S.** Native of Brazil, in fields, in the province of Minas Geraes. Myrtus decussata, Mart. herb. Leaves 6 lines long and 3 lines broad. Branches and branchlets opposite, slender. Stamens very numerous. Calyx glabrous.

*Decussate*-branched Guava. Shrub 2 to 3 feet.

27 P. ? desertorum (Mart. herb. ex D. C. prod. 3. p. 256.) branches terete, and are as well as the petioles and pedicels clothed with short velvety down; leaves ovate, acute, rather cordate at the base, with crenate margins, glabrous on both surfaces, full of pellucid dots; pedicels 1-flowered, slender; fruit ovate; lobes of calyx roundish. **h. S.** Native of Brazil, in the desert of Bahia. A small neat tree, with pale green leaves. Leaves 15-18 lines long, and 7-9 lines broad. Pedicels 2-3 lines long. Leaves 6-12 lines long. Flowers small.

*Desert Guava.* Tree to 3 feet.

28 P. ? tenuifolium (Mart. herb. ex D. C. I. c.) branches terete, glabrous as well as the petioles and pedicels; pedicels 1-3 together, axillary, 1-flowered; leaves obtuse, obtuse at the base, but acuminate at the apex, glabrous, but beset with crowded, very minute dots: fruit globose; lobes of calyx roundish. **h. S.** Native of Brazil, in the desert of Bahia. Fruit 5-celled; cells biovaluate. Pedicels 5-6 lines long, slender, braceless at the apex. Leaves membranous. Very nearly allied to P. desertorum.

*Fine-leaved Guava.* Tree 15 to 20 feet.

29 P. olophyspermum (Mart. herb. ex D. C. I. c.) branches terete or compressed, slender, glabrous; leaves elliptic, acuminate, glabrous, full of pellucid dots; pedicels 1-flowered, rather compressed, thrice the length of the pedicles; flower-bud oblong, acute; fruit obovate, subglobose, terminate at the base, 1-5-seeded. **h. S.** Native of Brazil, in woods on the banks of rivers in the province of Bahia. Bark greyish. Leaves an inch long and 5-6 lines broad. Fruit nodding, yellow. Seeds imbedded in bitter, rather diaphanous pulp. P. oligospermum, Link, enum. is perhaps different from this.

*Fern-seeded Guava.* Shrub 8 to 10 feet.

30 P. lanuginosum (Ruiz, et Pav. fl. per. ind. 4. t. 421. f. b.) branches terete; leaves oblong, obtuse, coriaceous, waxy; peduncles 3-flowered, the middle flower sessile, and the lateral ones pedicellate, bearing 2 bracteas at the base of each; tube of calyx long, 4-cleft, with the lobes acute; stamens exerted. **h. S.** Native of Peru. Petals obovate. Fruit long, terete, 4-celled, crowned by the lobes of the calyx. Seeds reniform. Shrub woolly in every part.

*Woody Guava.* Shrub 6 to 8 feet.

31 P. ? myrt柿es (D. C. prod. 3. p. 256.) branches terete, and with pubescent hairs; pedicels axillary, solitary, 1-flowered, angular, hairy; bracteole deciduous; ovary terminate, glabrous; lobes of calyx 5, very blunt; leaves oblong, almost sessile, obtuse at the base, acutish at the apex, villose on the margins, and middle nerve above the rest glabrous. **h. S.** Native of Brazil, in deserts, in the provinces of the mines. Myrtus myrsinites, Mart. herb. Pedicels 3-4 lines long. Throat of calyx broad, and staminiferous, as in Psidium. Leaves 12-15 lines long, and 5-4 broad. Perhaps a species of Myrtus.

*Myrtle-like Psidium.* Tree 12 feet.

32 P. brownii (Mart. herb. ex D. C. I. c.) branches hairy; pedicels solitary, axillary, 1-flowered, with lanceolate-linear bracteoles under the flowers; flower-bud ovate, acute, glabrous, at length splitting unequally into 5 roundish lobes; leaves ovate, almost sessile, bluntly attenuated at the apex, opaque, glabrous on both surfaces as well as the branches. **h. S.** Native of Brazil, in the desert of Bahia. A small, densely branched tree, with greyish bark. Leaves 2 inches long and 1 inch broad, with rather revolute margins. Petals roundish. Stamens usually changing into elliptic petals. Fruit unknown.

*Brown's Guava.* Tree 10 to 12 feet.

33 P. obovatum (Mart. herb. ex D. C. I. c.) branches terete, velvety from short down; leaves obovate, coriaceous, quite glabrous in the adult state, but when young rather velvety; fruit nearly globose, glabrous. **h. S.** Native of Brazil, in fields, in the province of St. Paul. Very like the Brasilian P. Cattleyanum, but differs in the branches being beset with short villi.

*Obovate*-leaved Guava. Shrub 10 to 15 feet.

34 P. cattleyanum (Sabine, in hort. trans. 4. p. 315. t. 11.) branches terete, glabrous; leaves obovate, coriaceous, quite glabrous in the adult state; but when young rather velvety; fruit nearly globose, glabrous. **h. S.** Native of China and of Brazil, or rather originally brought from China to Brazil. Lindl. coll. t. 16. Ker. boi. reg. 622. P. coriaceum, Mart. herb. P. Chine, Lodd. cab. The fruit of this *Guava* is rather large, nearly spherical, of a fine deep claret colour, growing in the axis of the leaves; the skin has much the consistence of that of a fig, but is thinner; the interior is a soft fleshy pulp, purplish red next the skin, but becoming paler towards the middle, and at the centre is quite white; it is juicy, and in consistence is much like a strawberry, to which it bears some resemblance in favour.

*Cattley's Guava.* Fl. May, Ju. Chit. 1818. Tr. 10 to 20 ft. 35 P. cordatum (Sims, bot. mag. t. 1779.) branches terete, glabrous; leaves sessile, cordate-roundish, rather stem-clasping,
coriaceous, glabrous on both surfaces; pedicels aggregate or few-flowered, longer than the flowers. h. S. Native of Guadaloupe. P. amplexicaule, Rich. in herb. Juss. Pers. ench. 2. p. 27.

36 P. emarginatum (Ruiz et Pav. fl. per. ind. 4. t. 418.) peduncles axillary; leaves ovate, obtuse, coriaceous, somewhat cordate at the base, and emarginate at the apex, much shorter than the peduncles; fruit globose, crowned by the lobes of the calyx: calyx 4-lobed; petals 4. h. S. Native of Peru. Branches apparently terete.

Emarginate-leaved Guava. Shrub 8 to 10 feet.

37 P. macrostemon (Ruiz et Pav. fl. per. ind. 4. t. 420. f. a.) branches dichotomously branched; leaves small, crowded, ovate, acute, downy; pedicels rising from the axils of the upper leaves, all 1-flowered, and forming a terminal raceme; stamens very long; stigma somewhat capitate; calyx 4-lobed; petals 4, obovate. h. S. Native of Peru. Branches apparently terete.

Long-armed Guava. Shrub.

38 P. rubrum (Ruiz et Pav. fl. per. ind. 4. t. 420. f. b.) branches terete; leaves oval, acuminate, wrinkled; pedicels axillary, solitary, 1-flowered; fruit oval, rugged, crowned by the lobes of the calyx: petals 5. h. S. Native of Peru.

Rugged-fruited Guava. Shrub.

† Species not sufficiently known.

39 P. du'num (H. B. et Kunth, nov. gen. amer. 6. p. 159.) branchlets compressed; leaves on short petioles, lanceolate, terminating each in a long, narrow acumen, membranous, glabrous; pedicels racemose, short, few-flowered. h. S. Native of South America, among rocks on the banks of the Orinoco, near Atures. Calyx 4-lobed; petals 4. Ovarium 2-celled; cells 2-seeded. Perhaps a species of Myrtus or a Eugenia.

Doubtful Guava. Shrub 2 to 3 feet.

40 P. caninium (Lour. coch. p. 310.) leaves on short petioles, ovate, acutish, tomentose on both surfaces; pedicels racemose, many-flowered, axillary, and terminal; fruit ovate. h. G. Native of China, about Canton. Lourinou calls this P. caninium, because dogs are delighted with it in the same manner as cats with valerian. The leaves are rather serrated. This species comes very near to P. pumilum.

Dog's Guava. Shrub 2 to 3 feet.

41 P. ni'rum (Lour. l. c.) leaves ovate-lanceolate, glabrous on both surfaces, scattered; pedicels terminal, branched: fruit globose. h. G. Native of Cochinchina, in woods. Berry small, black. Leaves serrated.

Black-fruited Guava. Tree.

42 P. ru'rum (Lour. l. c.) leaves oblong, obtuse, glabrous, on short petioles; flowers axillary, sessile, crowded, 4-petalled; fruit oblong. h. G. Native of Cochinchina, in woods. Berry red, small, with an acid sweet taste.

Red-fruiting Guava. Tree.

43 P. lindii (Raddi, mem. p. 6.) leaves rather fleshy, shining, rounded at the apex; berries roundish, sessile. h. S. Native of Brazil, where it is cultivated for its fruit, and has probably been imported from the East Indies.

Indian Guava. Tree 10 to 12 feet.

44 P. latifolia (Link, enfin. p. 27.) leaves tapering into the petiole, which is short, and somewhat acuminated. h. S. Native of South America. Nothing more is known about this plant.

Broad-leaved Guava. Shrub 10 to 12 feet.

Vol. II.

Will met's Guava. Shrub.

Cult. The species of Guava grow freely in a mixture of loam and peat. Cuttings will strike root if planted in sand, with a hand-glass over them. Some of the species fruit in the stoves of this country; but they are hardly worth the trouble and expense, to grow them for this purpose.

Lam. syst. Icosandra, Monogyna. Tube of calyx turbinate-globose; limb 4-parted, even to the base; lobes distinct in the bud. Petals 4. Stamens numerous, free, inserted in a broad disk, as in Psidium. Fruit fleshy, turbinate-globose, crowned by the calyces lobes, many-seeded. Seeds not well known.—Trees and shrubs, natives of the Mauritius, where they are commonly called Bois de néfle by the colonists. Leaves stiff. Pedicules axillary, 1-flowered, bibracteolate, under the flowers. Fruit edible. This genus is not well known; it differs from Eugenia in the broad staminal disk; in the fruit being many-seeded, and in the seeds being like those of Myrtus: it differs from Psidium in the lobes of the calyx being 4, not 5, and in the flower-bud; from Myrtus and Myrcia in the parts of the flower being 4, not 8.

1 J. mespiloides (D. C. prod. 3. p. 337.) leaves ovate-lanceolate, on long petioles, coriaceous, with revolute margins, glabrous and shining above, but velvety beneath, as well as on the branches and pedicules; pedicels 1-flowered, longer than the petioles. h. S. Native of the Island of Bourbon, where it is called Bois de poêche marron, Bois de néfle à grandes feuilles. Eugenia mespiloides, Lam. dict. 3. p. 205. Myrtus mespiloides, Spreng. syst. 2. p. 481. Petioles 8 lines long. Pedicels nearly an inch long. Fruit, according to the specimen in Jussieu's herbarium, ovate, fleshy, crowned by the calyx, velvety-sensate. Flowers large.

Medlar-like Jossinia. Tree 50 feet.

2 J. l'ucida (D. C. prod. 3. p. 337.) leaves obovate-ornicular, on short petioles, glabrous, coriaceous, pale beneath; flowers solitary, on short pedicels. h. S. Native of the Mauritius, where it is commonly called Bois de clour. Eugenia luzica, Lam. dict. 3. p. 205. Myrtus Commersoni, Spreng. syst. 2. p. 470. Fruit obovate-globose, glabrous, crowned by the obtuse lobes of the calyx.

Shining Jossinia. Tree.

3 J. orbiculata (D. C. l. c.) leaves roundish, obtuse, coriaceous, glabrous, on short petioles, with reflexed margins; pedicels very short, 1-flowered, 5-6 together in a fascicle, and are as well as the calyces rather velvety. h. S. Native of the Mauritius. Eugenia orbiculata, Lam. dict. 3. p. 204. Myrtus orbiculata, Spreng. syst. 2. p. 480. There is a variety of this with solitary pedicels. Leaves 2 inches broad and hardly 2½ inches long. Pedicels 3 lines long.

Orbicular-leaved Jossinia. Cht. 1823. Shrub 6 to 8 feet.

4 J. elliptica (D. C. l. c.) leaves elliptic, attenuated at the base, bluish at the apex, glabrous, rather coriaceous, on short petioles; flowers axillary, 2-4 in a fascicle, almost sessile; calyces pubescent. h. S. Native of the Mauritius. Eugenia elliptica, Lam. dict. 3. p. 206. but not of Smith. Flowers small. Lateral nerves of leaves hardly prominent, with the limb opaque, without any pellucid dots.

Elliptic-leaved Jossinia. Shrub 2 to 3 feet.

5 J. tintonia (D. C. prod. 3. p. 238.) leaves oval, coriaceous, on short petioles, when young clothed with white velvety down as well as the branchlets, pedicules, and calyces; pedicels solitary or twine, 3 or 4 times longer than the leaves. h. S. Native of the Mauritius, where it is called Bois de néfle. 50
Eugénia tinifolia, Lam. dict. 3. p. 204. Perhaps sufficiently distinct from J. brixifolia. Pedicels 3-4 lines long.

*Tinus-leaved* Jossinia. Tree or shrub.

6 J. Buxifolia (D. C. 1. c.) leaves ovate-oblong, bluish, coriaceous, glabrous, on very short petioles, with reflexed margins, pale beneath; pedicels solitary, slender, shorter than the leaves, exactly axillary; calyxes clothed with silky velvety down. F. S. Native of the Island of Bourbon, on the mountains, where it is called *Bois de nêfle commun*. Eugénia buxifolia, Lam. dict. 3. p. 204. Myrtus Borbónica, Spreng. syst. 2. p. 481. Pedicels 7-8 lines long. Flowers small. Fruit unknown.

*Box-leaved Jossinia*. Shrub.

7 J. Cotinifolia (D. C. 1. c.) leaves ovate or roundish, obtuse, rather coriaceous, with somewhat revolute margins, on very short petioles, full of pellicid dots, glabrous on both surfaces, pale beneath; pedicels 1-3 together, axillary, or supra-axillary, very slender, a little shorter than the leaves. F. S. Native of the Island of Bourbon, on the mountains. Eugénia cotinifolia, Jacq. obs. 3. p. 3. p. 53. Myrtus cotinifolia, Spreng. syst. 2. p. 481. exclusive of the country. Leaves an inch long. Pedicels 8-10 lines long; in some specimens always solitary.

*Cotinus-leaved Jossinia*. Shrub.

8 J. Cassinoides (D. C. 1. c.) leaves ovate, acute at both ends, coriaceous, glabrous, full of pellicid dots; pedicels 2-3-together, filiform, shorter than the leaves; lobes of calyx roundish. F. S. Native of Madagascar. Eugénia cassinoides, Lam. dict. 3. p. 205. Myrtus cassinoides, Spreng. syst. 2. p. 481.

*Cassine-like Jossinia*. Tree.

Cult. All the species of Jossinia are worth cultivating, for the sake of their beautiful foliage, as well as for their flowers, which are rather large and white. Their culture and propagation are the same as that recommended for *Phidium*, p. 833.

LIN. SYST. Lecuándrio, Monogénia. Tube of calyx sub-globose; limb 5-parted, rarely 4-parted. Petals 5, rarely 4. Stamens free. Berry 2-3-celled, nearly globose, crowned by the limb of the calyx. Seeds numerous in each cell even when mature, rarely solitary, bony, reniformly incurved. Embryo curved, with very short semiyelindrical cotyledons, which are much shorter than the radicle. Shrub. Leaves opposite, full of pellicid dots. Pedicels axillary, 1-flowered. In the most part of the species the flowers and seeds are unknown; it is therefore doubtful whether many of them belong to the genus *Myrceia*. A great many of them probably belong to the genus *Myrceia*.

SECT. I. LEUCOMYRTUS (λευκος, white, and μυρος, myrotos, a myrtle; in reference to the white flowers of the species). D. C. prod. 3. p. 288. Flowers white. Seeds curved in the manner of a horse-shoe; when mature disposed irregularly in the cells.

* Flowers 4-cleft, with few stamens.

1 M. Nummularia (Poir. dict. 4. p. 407. exclusive of the country). Pedicels axillary, solitary, 1-flowered, shorter than the leaves, bracteolate at the apex; leaves small, elliptic-ovate, acute, coriaceous, veinless, glabrous; branchlets hairy; calyx 4-lobed; stamens 8. F. S. Native of Peru. Leaves 3-4 lines long. Petals ciliated. Berry subglobose, 2-3-celled. Seeds few, rather reniform. Embryo of *M. communis*. Allied to *M. nummularia*.

*Whistle-berry-like Myrtle*. Sh. 1 ft.

2 M. Microphylla (Humb. et Bonpl. pl. equin. 1. p. 19. t. 4.) pedicels axillary, solitary, 1-flowered, shorter than the leaves, bearing 2 bracteoles under the flowers; leaves ovate, acute, coriaceous, glabrous above, and clothed with adpressed silky down beneath; calyx 5-cleft, hairy. F. S. Native of the cold mountains of Saragura, near Loja. Habit of *Phytica* or *Erica*. Petals white, ciliated. Margins of leaves revolute, 4 lines long. Berry red, globose, 2-3-celled. Ovalula 2-3 in each cell. Embryo like that of *E. communis*, according to Kunt. *Small-leaved Myrtle*. Sh. 3 ft.

** Flowers 5-cleft, polyandrous.

3 M. communis (Lin. spec. p. 673.) pedicels solitary, 1-flowered, about the length of the leaves, bearing 2 linear bracteoles under the flowers; calyx 5-cleft; leaves ovate or lanceolate, acute. F. S. Native of the south of Europe, on exposed rocks. Berry roundish, 2-3-celled. Seeds reniform. Embryo arched, with a long radicle, and small, equal cotyledons. Germ. fruct. 1. p. 181. t. 38. Lam. ill. t. 410. Duch. ed. nov. 1. p. 43. Corolla white. The common *myrtle* is well known as an elegant evergreen sweet-scented shrub, but unfortunately just too tender to abide our winters in the open air, without some protection. It was a great favourite among the ancients, and was sacred to Venus. *Myrtle* wreaths adorned the brows of bloodless victors, and were the symbol of authority for magistrates at Athens. Both branches and berries were put into wine, and the latter were used in the cookery of the ancients. The *myrtle* was also one of their medicinal plants. All parts of it are astringent, but it is discarded from modern practice.

A. melanoepica (D. C. prod. 3. p. 239.) fruit blackish. This variety of *myrtle* is frequent in the south of Europe, and in gardens, where there are varieties of it with double flowers and variegated leaves.

Var. a, Romina (Mill. fig. t. 184. f. 1.) leaves ovate; pedicels longer. The common broad-leaved or Roman *myrtle*. It is sometimes called *flowery myrtle*, because it flowers more freely in England than any other variety.

Var. b, Tarentina (Mill. dict.) leaves ovate; berries rounder. The box-leaved *myrtle*. Flowers small, and open late in the autumn. Leaves small.

Var. γ, Italica (Mill. dict.) leaves ovate-lanceolate, acute; branches more erect. The Italian or upright *myrtle*.

Var. ε, Bacica (Mill. dict.) leaves lanceolate, acuminate. The orange-leaved *myrtle*.—Blackw. t. 114.

Var. ε, Lucidina (Linn. spec.) leaves lanceolate-ovate, acute. M. acuta, Mill. dict.—Claus. hist. 1. p. 66. f. 1. The *Portuguese myrtle*. The nutmeg *myrtle* appears to be only a variety of this.

Var. δ, Bellica (Mill. dict.) leaves lanceolate, acuminate.
The broad-leaved Dutch myrtle. Leaves crowded, dark green. The double-flowering myrtle appears to be of this variety.

Var. 9. "meuonata" (Lin. spec.) leaves linear-lanceolate, acuminate. M. minima, Mill. Rosemary or thyme-leaved myrtle. B. leucocarpa (D. C. prod. 3: p. 239.) Fruit white. \( \gamma \). H. Native of Greece and the Balearic Islands, Smith, prod. fl. geec. p. 36. The fruit of this kind is rather large, edible, with a grateful taste and smell.

The above varieties are constant; but there are others in the gardens which are more variable. It will suffice to give the names of a few of these.

1. Gold-striped broad-leaved myrtle.
2. Broad-leaved Jews' myrtle. This variety has its leaves frequently in threes, on which account it is said to be in esteem among the Jews in their religious ceremonies.
4. Silver-striped Italian myrtle.
5. Striped box-leaved myrtle.
7. Silver-striped wnutmeg myrtle.
8. Cock's-camb or bird's nest myrtle.

6 M. MYRTODES (H. B. et Kunth, nov. gen. amer. 6: p. 151; t. 539.) peduncles axillary, 1-flowered, harder shorter than the leaves, pubescent, furnished with 2 bracteoles at the apex; leaves oblong, coriaceous, veinless, glabrous above, puberulous beneath as well as on the branchlets; calyx 5-cleft. \( \gamma \). S. Native of Peru. Petals glabrous. Berry nearly globose, 3-4-celled. Seeds numerous, nearly reniform. Embryo as in M. communis.

Myrica-leaved Myrtle. Sh. 4 to 6 ft.

7 M. SALUTARIS (H. B. et Kunth, l. c. p. 132.) peduncles axillary, solitary, 1-flowered, shorter than the leaves, puberulous; leaves ovate-oblong, obtuse, rather membranous, reticulated, glabrous, shining; branchlets rather hairy; calyx quinquifid. \( \gamma \). S. Native near Carichana, on the banks of the Orinoco, where it is called Guayanac-Arayan. Leaves 2 inches long, and an inch broad. Petals ciliated, length of stamens. Berry nearly globose, 2-celled, about the size of a sloe. Seeds bony, solitary, or numerous in the cells. A decoction of the root of this species is considered good against hemorrhages.

Solitary Myrtle. Sh. 4 to 6 ft.

8 M. CALIFORNIANA (H. B. et Kunth, l. c. p. 133.) peduncles axillary, 1-flowered, solitary, or twin, shorter than the leaves, lustrate at the apex; leaves elliptic-oblong, acute, running into the petiole at the base, coriaceous, veinless, shining, and are as well as the branchlets glabrous; calyx 5-cleft. \( \gamma \). S. Native on the banks of the Orinoco, near Maypures. Leaves 2 inches long. Pedicels 10-14 lines long, when bearing the fruit. Flowers as large as those of M. communis. Berry nearly globose, 2-celled, about the size of a sloe. Embryo probably like that of M. communis.

Beautiful-leaved Myrtle. Sh. 6 to 8 ft.

9 M. UGNI (Molin. chil. ed. gall. p. 133.) peduncles axillary, 1-flowered, a little recurved, rather longer than the leaves, bearing 2 can bracteoles under the flower; leaves ovate, acute, glabrous; calyx 5-cleft, with the lobes reflexed. \( \gamma \). G. Native of Chili, where it is called Ugni, and by the Spaniards Myrtilla. Fruell. obs. 3: p. 44; t. 31. Lam. dict. 4: p. 412. Petals almost like those of M. communis. Fruit red, musky, nearly globose, 8-seeded, compressed. The natives of Chili express the juice from the fruit and mix it with water, to which it gives a beautiful red colour. It forms a very refreshing drink, and has something of the odor of rosemary.

Ugni Myrtle. Sh. 2 to 3 ft.

10 M. ARAYAN (H. B. et Kunth, l. c. p. 133.) peduncles axillary, solitary, 1-flowered, a little shorter than the leaves, bracteate under the flower; leaves ovate-oblong, acute, membranous, reticulated, glabrous, shining; branchlets hairy; calyx 5-cleft. \( \gamma \). S. Native of Chili and Peru, at Gauzana, on the elevation of 3000 feet, at which height is a line of trees, where it is called, along with some other species, Arayana. Leaves 22-23 lines long. Flowers of size of those of M. communis. Berry globose, red, 2-celled; cells 1-seeded.

Arayana Myrtle. Sh. 6 to 8 ft.

11 M. MULTIFLORA (Juss. herb. Jaume, in Duham. ed. nov. 1: p. 208.) peduncles solitary, axillary, elongated, and in terminal racemes; flowers 5-cleft; leaves ovate-orbicular, mucronate, opake, coriaceous, hairy on the petioles, margins, and nerves on both surfaces, as well as the branchlets and peduncles. \( \gamma \). S. Native of Chili and Peru. Leaves 8-9 lines long and 6-7 broad, green above, and white beneath. Pedicels 6 inches long, glabrous at the apex, as well as the calyxes, but hairy at the base. Fruit and seeds unknown. Perhaps the same as M. Lima, Molin. chil. 175. but M. Lima of Spreng. syst. appears to be different. The bark is astringent, and possesses the same qualities as that of M. agni.

Many-flowered Myrtle. Shrub.

12 M. GOETHIEANA (Mart. herb. ex D. C. prod. 3: p. 240.) peduncles 1-flowered, 3 times shorter than the leaves, bearing 2 acute bracteoles at the apex: lower ones axillary and solitary: upper ones in umbellate fascicles: leaves oval, acuminate, rather coriaceous, quite glabrous, shining. tube of calyx globose, with 5 oblong-oval lobes. \( \gamma \). S. Native of Demerara, and of Brazil at Rio Janeiro. Leaves 4 inches long, 15-16 lines broad, opake, dotted beneath. Peduncles 9 lines long. Flowers large. Pedals 7-9 lines long. Staminiferous disk broad, as in Psidium. Ovarium globose, 2-3-celled. Stamens very numerous, shorter than the petals. Fruit globose, yellowish, 5-celled. Seeds many, oblong.

Goethe's Myrtle. Shrub.

13 M. I ELEGANS (D. C. prod. 3: p. 240.) glabrous; peduncles axillary, 1-flowered, solitary, about equal in length to the leaves; bracteas small under the flowers; lobes of calyx 4, broad, acute, quite glabrous, shining, tube of calyx globose, with 5 oblong-oval lobes. \( \gamma \). S. Native of Brazil, in the province of Minas Geraes. Psidium elegans, Mart. herb. Habit almost of M. communis var. Romana. In habit it comes near Eugenia Pia; but neither the flower-bud nor fruit has been seen, and therefore the genus is very doubtful.

Elegant Myrtle. Shrub.

14 M. FASCICULARIA (D. C. l. c. 1.) peduncles 1-flowered, 4-7 together, axillary, a little shorter than the leaves, bearing 2 linear bracteoles under the flowers; leaves oval-oblong, acute at both ends, full of pellucid dots, clothed with velvety pubescence when young, as well as the calyxes: calyx 5-lobed; lobes very obtuse. \( \gamma \). S. Native of Cayenne. Flowers and leaves rising in fascicles from the axils of the old leaves, as in Pyrus. Pedicels 6 lines long. Fruit and seeds unknown. Limb of calyx 5-cleft, not 5-parted.

Fasciculate-flowered Myrtle. Shrub.

15 M. BRACHYSTEUMON (D. C. l. c. 1.) peduncles 1-flowered, axillary, 3-5 together, 3 times shorter than the leaves, bearing 2 oval bracteoles under the flowers; leaves oval, glabrous, bluntly somewhat acuminate; calyx 5-cleft; branchlets rather downy. \( \gamma \). S. Native of St. Domingo and Porto Rico, in hedges. Eugenia Putrisis, Spreng. in herb. Bull. but not of Vahl. Leaves an inch long, and 6 lines broad. Pedicels 3-5 lines long. Flowers small. Stamens 20, shorter than the petals. Fruit and seeds unknown.

Short-stamened Myrtle. Shrub.

sect. II. RHODANCYTE. (from _pocov_, _rhodan_, a rose, and _wp-5_ 2_0_2)
Myrtaceae. XXVII. MYRTUS.

16 M. tomentosum (Ait. Hort. kew. 2. p. 159.) peduncles 1-3-flowered, bearing 2 ovate bracteoles under each flower, shorter than the leaves, and are, as well as the branches and calyxes, velvety; leaves ovate, velvety above in the young state; clothed with hoary tomentum beneath, 3-nerved, with the lateral nerves almost marginal; calyx 5-cleft. G. Native of China, Cochinchina, and among the Nellyberry Mountains in the East Indies, and in the Island of Junkseyon, ex Sallysh. Curt. bot. mag. t. 250. Lois. herb. amat. t. 267. M. canescens, Lour. coch. p. 311.—Plit. alm. t. 372. f. 1. Petals rose-coloured, longer than the stamens and style, velvety on the outside. Fruit ovate, 3-celled. Seeds compressed, 2 series in each cell. Embryo as in M. communis according to Kunth. There is a smoother variety of this species which goes under the name of M. affinis in the gardens.

Tomentose Myrtle. Fl. June, July. Clt. 1776. Sh. 2 to 6 ft. 17 M. spectabilis (Blume. hort. p. 1088.) pedicles crowded, axillary, 1-flowered, shorter than the leaves; calyx silky, 4-cleft; leaves ovate-oblong, 3-nerved, bluntly acuminate, acutish at the base, coriaceous, glabrous, greyish silvery beneath. S. Native of Java, in the province of Bantam. Fruit unknown.

Shiny Myrtle. Shrub.

† In the following species the seeds, fruit, and number of the parts of the flower being unknown, it is therefore doubtful whether any of them belong to the genus. Many of them on future examination may prove to belong to the genus Myrtia, especially those natives of South America.

* Peduncles axillary, 1-flowered.

18 M. leontopodium (Spreng. syst. 2. p. 27th.) pedicles axillary, 1-flowered, usually solitary, shorter than the leaves; leaves petiolate, linear, obtuse, nerveless, glabrous, flat beneath. S. Native of the West Indies. The rest unknown. Perhaps the same as Eugenia leptoaspermides.

Flax-leaved Myrtle. Shrub.

19 M. teniophila (Smith in Lin. trans. 3. p. 280.) pedicles axillary, solitary, 1-flowered, shorter than the leaves; leaves linear, mucronate, with revolute margins, pubescent beneath; calyxes glabrous; petals pubescent. G. Native of New Holland. Leaves an inch long, and one line broad. Flowers white, one-half smaller than those of M. communis. Fruit and seeds unknown.

20 M. Grammica (Spreng. syst. 2. p. 480.) pedicles 1-flowered, usually solitary, capillary, shorter than the leaves; leaves oblong, attenuated at both ends, obtuse, full of parallel veins, and are, as well as the branches, glabrous. S. Native of Brazil.

Written-leaved Myrtle. Shrub.

21 M. lurida (Spreng. l. c.) pedicles 1-flowered, usually solitary, stiff; shorter than the leaves, stipulate at the base; leaves sessile, lanceolate, cuspidate, quite glabrous on both surfaces, reticulately veined. S. Native of Monte Video.

Lurid Myrtle. Shrub.

22 M. ovata (Spreng. syst. 2. p. 479.) pedicles 1-flowered, usually solitary, exceeding the leaves; leaves oval, veiny, glabrous; branches covered with fuscous villi. S. Native of Brazil.

Oval-leaved Myrtle. Shrub.

23 M. Hevyn (Spreng. l. c. p. 248.) pedicles axillary, 1-flowered, usually solitary, length of the pediotes, bracteate at the base, and bibracteolate at the apex; leaves elliptic, obtuse, coriaceous, full of pellicud dots, clothed with rusty tomentum when young, as well as the branchlets and pedicels. S. Native of the East Indies. Myrtus latifolia, Roth. nov. spec. p. 223. but not of Avildia. Leaves 3 inches long, and 2 inches broad. Petioles 2 lines long. Fruit, seeds, and number of the lobes of calyx unknown.

Var. b. conferta (D. C. prod. 3. p. 241.) pedicles 3-5-toothed; flowers a little smaller than those of the species. Roth, l. c.

Heyne's Myrtle. Shrub.

24 M. erythroxylonoides (H. B. et Kunth, nov. gen. amer. 6. p. 149.) flowers 3-6-together, axillary, and terminal, 4-5-petalled; leaves elliptic, emarginate, coriaceous, glabrous, shining; branchlets rather hairy. S. Native of South America, near Cumana. Flowers, fruit, and seeds unknown.

Erythroxylon-like Myrtle. Shrub.

** Peduncles axillary, 2-3 or many-flowered.

25 M. lucera (Lin. spec. p. 674.) pedicles usually 3-flowered; flowers 5-petalled, nearly sessile, disposed into a tapering lanceolate spike. S. Native of Suriyam.

Shining Myrtle. Shrub or tree.

26 M. seloii (Spreng. syst. 2. p. 482.) pedicles capillary, 3-flowered, shorter than the leaves; flowers 5-cleft; leaves oblong, attenuated at both ends, bluntish, opaque, pale and veiny beneath. S. Native of Brazil.

Sello's Myrtle. Shrub.

27 M. vestita (Spreng. syst. add. p. 193.) leaves lanceolate, acute, veiny, clothed with woolly tomentum, as well as the branchlets; peduncles very short, nearly opposite; flowers 4-cleft. S. Native of Brazil, at Rio Grande.

Clothed Myrtle. Shrub.

28 M. megapotamica (Spreng. l. c.) leaves lanceolate-spatulate, obscurely veined, clothed with yellowish silky down beneath; peduncles aggregate, shorter than the leaves; flowers quadridi. S. Native of Brazil, at Rio Grande.

Rio Grande Myrtle. Shrub.

29 M. triflora (Spreng. l. c. but not of Jacq.) peduncles straight, bracteate, 3-flowered, about equal in length to the leaves; flowers crowded, 5-cleft; leaves ovate-lanceolate, acute, glabrous, shining above, and reticulated with veins beneath. S. Native of Monte Video.

Three-flowered Myrtle. Shrub.

30 M. russifolia (Willd. spec. 2. p. 970.) peduncles axillary, short, crowded, many-flowered, pubescent; leaves roundish-elliptic, quite glabrous, and full of pitted dots above. S. Native of the East Indies. Leaves almost the size of those of Rhus aculeatus, but a little larger and more blunt; when young ornamented with rufescent pili. Flowers and fruit unknown.

Butcher's-broom-leaved Myrtle. Shrub.

* * * Peduncles many-flowered, coriybose, or in branched panicles.

31 M. firma (Spreng. syst. 2. p. 487.) panicles axillary, opposite, trichotomous, tomentose, rather shorter than the leaves; leaves ovate-elliptic, coriaceous, large, rufescent, glabrous, veiny. S. Native of Brazil. The rest unknown.

Firma Myrtle. Shrub.

32 M. akeria (Spreng. neue. entd. 2. p. 170. syst. 2. p. 487.) panicles axillary, erect, about equal in length to the leaves; leaves lanceolate, nearly sessile, coriaceous, shining, full of parallel veins, discoloured beneath; branches 2-edged, quite smooth. S. Native of Brazil.

Two-edged-branched Myrtle. Shrub.
**MYRTACEÆ. XXVII. MYRTUS. XXVIII. MYRICA.**

33. M. dioica (Lin. spec. 675.) peduncles axillary and terminal, trichotomously panicled, length of the leaves; leaves oblong; flowers dioecious. *S.* Native of South America. M. dioica, Spreng. syst. 2. p. 486, is probably different from the plant of Lin.

**Dioecious Myrtle.** Shrub.

34. M. fulva (Spreng. syst. 2. p. 487.) panicle terminal; flowers crowded; leaves oblong-lanceolate, glabrous, as well as the branches. *S.* Native of Japan. Berry 2-5-celled; cells 1-seeded. Branches and buds alternate. Leaves solitary, erect or twined. Said to be allied to *Photinia*, and most probably belongs to the one-styled Rosaceous plants.

**Fulvous Myrtle.** Shrub.

35. M. umbraculosa (H.B. et Kunth, nov. gen. amer. 7. p. 258.) racemes axillary, bipartite; branches glabrous; leaves on short petioles, lanceolate-oblong, very much acuminate, acutish at the base, coriaceous, shining, with revolute margins, puberulous on both surfaces. *S.* Native in shady places on the banks of the Orinoco, near Maypures. Calyx globose. Ovarium 2-celled; cells biovulate. The number of petals and the fabric of the seeds are unknown.

**Shaded Myrtle.** Shrub.

36. M. maxima (Molin, chin. p. 173.) peduncles many-flowered; leaves alternate, nearly oval; trunk large. *S.* Native of Chili.

**Large Myrtle.** Shrub, 6 to 10 ft.

37. M. levis (Thunb. fl. jap. 198.) peduncles terminal, umbellate; calyx 5-toothed; leaves ovate, acuminate, acutely serrated, veiny, attenuated at both ends, coriaceous, shining above, reticulated with veins beneath, and clothed with fulvous villi, as well as the panicles and branches. *S.* Native of Brazil. The rest unknown.

**Smooth Myrtle.** Shrub.

38. M. psimoides (Desv. in Hamilt. prod. fl. ind. occ. p. 144.) peduncles axillary and terminal, crowded, and are, as well as the calyces, pubescent; leaves somewhat ovate-lanceolate, acuminate, full of parallel nerves, pubescent beneath. *S.* Native of the West Indies. Perhaps a species of *Myrrh.*

**Guava-like Myrtle.** Shrub.

39. M. umbellata (Desv. 1. c. p. 45.) flowers axillary and terminal, in umbellate fascicles; calyx campanulate, 5-toothed; stem dichotomous, disarticulate; branches rather cuneate; leaves ovate, acuminate, glabrous, veiny, nearly sessile. *S.* Native of Guiana. Perhaps a species of *Myrrh.*

**Umbellate-flowered Myrtle.** Shrub.

40. M. cauliflora (Mart.) trunk and branches excorticata, and bearing the flowers; leaves lanceolate, long-acuminate, all acute at the base, quite glabrous; flowers crowded; berry globose, of a violaceous purple colour. *S.* Native of Brazil.

**Stem-flowering Myrtle.** Shrub.

41. N. B. M. Chiennis, Lour. 8. p. 313. is a species of *Symphōca* according to Desv. in herb. mus. par. not probably distinct from *Symphōca Sínia*, Ker. bot. reg. t. 710.

**Cult.** All the species of *myrīle* grow well in a mixture of sandy loam and peat; and cuttings not too ripe strike root readily either in sand or mould.

**XXVIII. MYR KıA (a surname of Venus).** D. C. dict. class. hist. nat. vol. xi. and dissa. (1826.) D. C. prod. 3. p. 242.—*Myrī* species of Lin. and others.

**Lin. syst. Ieasándria, Monopolya.** Tube of calyx globose, rarely ovate (f. 122. a.); limb 5-parted. Petals 5 (f. 122. b.). Stamens numerous, free. Ovarium 2-5-celled; cells many-ovulate. Berry 1-2-celled, when mature 1-3-seeded. Seeds rather globose, with a smooth testa. Cotyledons foliaceous, corrugately contortuplicate.—Little trees or shrubs, natives of the West Indies and South America. Leaves opposite, quite entire, full of peculiar dots or opaque, furnished with nerves like those of *Myrītus*. Peduncles axillary and almost terminal, panicked, many-flowered. Flowers white. The species are disposed geographically, in consequence of not being sufficiently known, and therefore there are not more obvious characters as yet known for distributing them into sections.

§ 1. *Sperocodrýs* (from σφηρια, σφηνε, a sphere, and καρπος, a fruit; in reference to the fruit of all the species being spherical). D. C. prod. 3. p. 243. Fruit or tule of calyx spherical.

*Species natives of the West Indies.*

1. M. puncta'ata (D. C. prod. 3. p. 243.) peduncles axillary, opposite, about equal in length to the leaves, 3-flowered; flowers 5-cleft, middle flower on each pedicule sessile, lateral ones pedicellate; bracteoles setaceous; leaves oblong, bluntish, dotted on both surfaces, tender, silky, glabrous in the adult state. *S.* Native of the Island of Santa Cruz, not in the East Indies, as it is inacutiously written by Persoon. *Myrītus puncta'ta*, Spreng. syst. 2. p. 483. Eugenia punctata, Vahl. synb. 3. p. 64. Calyx 5-lobed. Petals 6, ex Vahl. but in all probability this is wrong, as it is impossible that the calyx can be 5-lobed, and the petals only 4 in number.

**Dotted-leaved Myrtle.** Shrub 3 to 6 ft.

2. M. Babīshīnā (D. C. prod. 3. p. 243.) peduncles axillary, longer than the leaves, cymosely-corymbose, biffid, and as, are as well as the compressed branches, full of dots; flowers 5-cleft, sessile in the forks of the corymb, the others pedicellate; bracteoles linear; leaves oval, obtuse, glabrous, full of pellucid dots. *S.* Native of Guadaloupe. Peduncles sometimes 2, concrete, teretish, ending in 4 bifid 5-flowered branchlets. Calyx dotted, with a silky tube, and a 5-lobed obtuse glabrous limb. Seeds unknown.

**Babīsh's Myrtle.** Shrub 4 to 6 ft.

**Divāricate Myrtle.** Shrub 4 to 6 ft.

4. M. sōrōnīa (D. C. 1. c.) peduncles axillary, shorter than the leaves, downy, having the flowers crowded in racemes at their tops; tube of calyx short, villous, with roundish pubescent lobes; leaves ovate-lanceolate, long and bluntly acuminate, full of pellucid dots, and reticulately veined; adult leaves glabrous on both surfaces; pedicels and branches terete and downy. *S.* Native of the Island of Trinidad. Sieb. fl. trin. no. 111. Very like *M. Haynāchāna*, but differs in the flowers being more crowded, in the leaves being much more distinct, full of pellucid dots, and the branches are terete not gradually compressed. Fruit unknown. The species are very rare.

**Sister Myrtle.** Shrub 5 to 10 ft.

5. M. deflex'sa (D. C. prod. 3. p. 244.) peduncles length of leaves, twin in the upper axis of the leaves, and therefore 4 subumbellate and terminal, panicked, many-flowered; flowers 5-cleft; pedicels twin, and are, as well as the branches, villous; leaves elliptic, acuminate, full of pellucid dots, rather shining above, somewhat coriaceous, girded by a marginal nervule. *S.* Native of St. Domingo. Eugenia deflex'sa, Poir. suppl. 3.
MYRTACEÆ. XXVIII. MYRCEA.

p. 124. Lobes of calyx roundish, full of pellucid dots. Style and all the parts of the inflorescence velvety. Leaves rather villous when young, adult ones glabrous, except on the nerves on the under surface, 2 inches long, and 9 lines broad, deflexed. Young fruit ovate. Cotyledons corrugated. Panicles twin in the axils of the upper leaves.

**Deflexed Myrcia.** Shrub 2 to 3 ft.

6 M. *Thomasiana* (D. C. l. c.) peduncles axillary and terminal, opposite, racemose, usually 6-flowered; pedicels opposite, 1-flowered, furnished with one bracteae at the base of each; flowers 5-cleft; leaves elliptic, acuminate, opaque, shining above, and full of impressed dots on both surfaces, as well as the branches. S. Native of the Island of St. Thomas, ex herb. Deless. Peduncules, bracteae, and calyces puberulous when examined by a lens. Stamens length of petals. Fruit and seeds unknown.

**St. Thomas Myrcia.** Shrub 6 to 10 feet.

7 M. *coriacea* (D. C. prod. 3. p. 243.) peduncles terminal, panicked, glabrous, longer than the leaves; branchlets distant, opposite, bearing 1-3 flowers at the apex; flowers 5-cleft, nearly naked; leaves obovate or elliptico-rhomboid, obtuse, coriaceous, often, with somewhat revolute margins, shining on both surfaces, and with a subterminal, full of impressed dots above, and as well as the leaves, glabrous. S. Native of the Caribbee Islands.

**Coriaceous-leaved Myrcia.** Clt. 1759. Shrub 4 to 6 ft.

**FIG. 122.**

8 M. *acris* (D. C. l. c.) peduncles axillary and terminal, trichotomously panicked; flowers 5-cleft, those in the forks sessile, the rest pedicellate; leaves ovate, coriaceous, opaque, shining; branchlets acutely tetragonal, and are, as well as the pedicels, glabrous. S. Native of the West Indies, and now cultivated in the East Indies. Myrtus pimienta latifolia, Roxb. hort. beg. p. 37. Myrtus citrifolia, Poir. dict. 4. p. 410. Div. ab. Eugenia citrifolia of the same author. As variable a plant as Eugenia Pimienta, the leaves lanceolate and acuminate, ex Poir., but oval and obtuse in the specimens, some collected in Guadaloupe, and others in the botanic garden at Calcutta, but it differs from Eugenia Pimienta in the branches being acutely tetragonal. The leaves, berries, and flower-buds have a hot taste, and a fragrant smell, like those of *M. acris*, and are used for culinary purposes.

**Pimento-like Myrcia.** Fl. May. Clt. 1759. Fig. 122.

10 M. *lepto'clada* (D. C. prod. 3. p. 244.) peduncles axillary and subterminal, loosely panicked, glabrous, length of the leaves; pedicels 1-flowered, short; flowers 5-cleft; leaves elliptic-oblong, acuminate, full of pellucid dots, and are glabrous, as well as the branches. S. Native of St. Domingo. Very like *M. multiflora*. Leaves 3 inches long, and an inch broad. Flowers small. Lobes of calyx 4, 2 obtuse, and 2 acutish. Berry globose, 1-seeded. Seeds shining. Cotyledons foliaceous, corrugately plicate.

**Slender-branched Myrcia.** Shrub 5 to 6 ft.

11 M. *splendens* (D. C. l. c.) peduncles axillary and terminal, panicked, and are as well as the branches villous; buds very villous; leaves ovate-elliptic, acuminate, full of large pellucid dots, glabrous, shining above, and red in the axil, and anacorment, and amomosoming veins; leaves small, 5-cleft. S. Native of St. Domingo and Guadaloupe, among shrubs on the mountains. Myrtus splendens, Swartz, fl. ind. occ. 2. p. 907. Eugenia perplicatolia, Jacq. coll. 2. p. 108. t. 4. Eugenia microcarpus, Lam. dict. 3. p. 201. Eugenia laxisfora, Poir. suppl. 3. p. 123. Leaves an inch and a half long. Berry globose, scarlet. Seeds 2, hemispherical. Cotyledons corrugated. There are varieties of this plant with the pedicel either longer or shorter than the leaves, and the flowers either 4 or 5-cleft.

**Var. *Plafonata* (D. C. l. c.) peduncles shorter than the leaves; flowers 4-cleft. S. Native of Cayenne. Eugenia Plafonata, Aubl. guian. 1. p. 498. t. 197. Perhaps a variety of *M. multiflora*, but according to the figure it comes nearer to *M. splendens*. Perhaps two species are confused under the name. Perhaps Eugenia patens of Poir. suppl. 3. p. 124. is referrible to this plant.

**Splendid Myrcia.** Clt. 1803. Tree 12 to 20 feet.

12 M. *multiflora* (D. C. l. c.) peduncles axillary and terminal, panicked, longer than the leaves, and as well as the branches, glabrous; leaves bluntly acuminate, membranous, full of pellucid dots, with the veins rather prominent on both surfaces, and confluent near the margin. S. Native of Cayenne. Eugenia multiflora, Rich. in act. soc. hist. nat. par. 1792. p. 110. Lam. dict. 3. p. 302. Myrtus multiflora, Spreng. syst. 2. p. 482. but not of Jaume. Allied to *M. splendens*, but differs in the flowers being small, glabrous, and 5-cleft. Fruit globose. Seeds 1-2, large, with a hard testa. Cotyledons foliaceous, corrugated.

**Many-flowered Myrcia.** Shrub.

13 M. *fallax* (D. C. l. c.) peduncles subterminal; racemis compressed; immature fruit ovate, but when mature globose; leaves glabrous, shining, elliptic, ending in an obtuse, oblong, abrupt acumen, having the lateral veins hardly prominent and confluent at the margins. S. Native of French Guiana. Eugenia fallax, Rich. act. soc. hist. nat. par. 1792. p. 100. Leaves full of pellucid dots. Pedicels pubescent. Lobes of calyx rounded at the base, smoothish, permanent, but the tube is white and downy. Seed 1. Style hooked, according to Leblond.
leaves leaves leaves
Native be as the branches. E. Native of Guiana, in woods. Myrtus sylvestica, Meyer, esseq. p. 191. Styles said to be 3. Fruit and seeds unknown.

Wood Myrica. Shrub. 4 to 6 ft.

15 M. platyclada (D. C. l. c.) peduncles axillary and sub-terminal, panicked, longer than the leaves, and are, as well as the branches, compressed, and consequently 2-edged; leaves 5-cleft; leaves ovate-oblong, acuminate, the apex, glabrous, but clothed with rusty velvet down beneath, but they at length become glabrous on both surfaces; calyx 5-cleft. E. Native of French Guiana. Myrtus ferruginea, Poir. suppl. 3. p. 124. Myrtus ferruginea, Spreng. exclusive of the synonyms. Leaves nearly like those of Eugenia chrysophylla or E. chrysophylloides, but it differs in the inoffensiveness. Fruit globose, glabrous, 2-3-seeded. Seeds large, angular, roundish. Cotyledons thickish, corrugated.

Rusty Myrica. Shrub. 4 to 6 ft.

22 M. capitata (D. C. l. c.) peduncles axillary, solitary, or twin, panicked, shorter than the leaves; flowers bluish-purple, the petals ovate-oblong, acuminate, strongly pubescent, and glanded by a marginal nerve, coriaceous, opaque, shining above, clothed with rufous velvet down beneath, as well as the pedicels and branches. E. Native of French Guiana. M. latifolia, Forsyth in herb. L'Her. Lateral nerves of leaves thick and prominent beneath. Fruit nearly globose, crowned, at length glabrous, 1-seeded. Seed roundish. Cotyledons foliaceous, corrugately plicate.

Thick-nerved-leaved Myrica. Shrub.

24 M. acerifolia (D. C. l. c.) peduncles axillary, 3-flowered, bearing opposite, leafy bracteas in the middle and at the base of the flowers, shorter than the leaves; leaves ovate-lanceolate, tapering into an elongated acumen, with rather revolute, ciliated, margined, having the middle nerve hairy on both surfaces; branches hispid; calyxes villous. E. Native of Cayenne and Brazil. Eugenia acerifolia, Rich. act. soc. hist. nat. 1792. p. 110. Myrtus acerifolia, Mart. herb. Leaves 2 inches long, and 9-10 lines broad, shining. Tube of calyx ovate, Style infeixed. Bracteas coloured, according to. Richard. Flowers 3-5-cleft, rarely 4-cleft. The fruit is that of Myrica, according to the specimen.

BRACTTEATA Myrica. Shrub.

* * Species natives of Brazil. * Fruit nearly globose, 1-3-celled.

a. Leaves on long or short petioles, never cordate at the base.

23 M. Haynea'na (D. C. l. c.) peduncles axillary, shorter than the leaves, racemose or subpaniculate, hairy; tube of calyx with a short, villous tube, and 5 roundish pubescent lobes; leaves oval-oblong, acuminate, full of pubellid dots, reticulately veined, glabrous in the adult state, except on the nerves beneath as well as the branches, which are rather hairy; buds silky. E. Native of Brazil, at Mato-Virga. Myrtus Haynea, Mart. herb. Leaves 3 inches long and an inch broad. Petioles 1-2 lines long. There are some black bristles at the axis of the leaves, which are almost stipular. Branchlets compressed. Fruit unknown. The shrub agrees with M. sororia on the one hand, and with M. bracteata on the other. Haynea's Myrica. Shrub.

26 M. guianensis (D. C. l. c.) peduncles axillary, opposite, racemose, 5-9-flowered, almost bracteate, about equal in length to the leaves; fruit globose, crowned by the lobes of the calyx, which are blunted; leaves oblong-obtuse, or nearly obovate, dotted on both surfaces, nearly nerveless and almost glabrous, even
Mojopome-like Myrcia. Sh. 4 to 6 ft.

27 M. salicifolia (D. C. L. c.) peduncles axillary, few-flowered, racemose, rather shorter than the leaves, glabrous; fruit globose, crowned by the lobes of the calyx, which are 5 and obtuse; leaves lanceolate-linear, attenuated at both ends, full of pehlcidic dots, glabrous in the adult state, but pubescent when young, as well as the branches. $\frac{1}{2}$ S. Native of Brazil, at Rio Tapura. Myr'tus salicifolia, Mart. herb. Leaves 2 inches long and 4 lines broad. Fruit the size of a pea. Seeds not seen. Flowers unknown.

Willow-leaved Myrcia. Sh. 4 to 6 ft.

28 M. daphnoides (D. C. L. c.) peduncles axillary, longer than the leaves, panicked, clothed with rufous hairs; lobes of calyx 5, roundish, eliuated in the young state; leaves oblong, obtuse, cuneated at the base, opaque, stiff, crowded, rather villous on both surfaces when young, but in the adult state glabrous and puberulous beneath: branches clothed with rufous down. $\frac{1}{2}$ S. Native of Brazil, near Camabu. Branches short, spreading, very leafy, when young sometimes compressed. Leaves an inch and a half long, but hardly half an inch broad, full of impressed dots on the upper surface when old. Racemes nearly 2 inches long. Fruit unknown.

Daphne-like Myrcia. Sh. 6 to 10 ft.

29 M. nigrescens (D. C. L. c.) peduncles axillary, nearly terminal, panicked, divaricately branched, longer than the leaves; branches and flowers quite glabrous; leaves oval-oblong, attenuated at the base, obtuse at the apex, opaque, stiff, almost nerveless, except the middle nerve, quite glabrous on both surfaces. $\frac{1}{2}$ S. Native of Brazil, at the river Amazon. Myr'tus nigrescens, Mart. herb. Leaves 2 inches long, and 8-12 lines broad, of an obscure green colour. Petioles 2-3 lines long, wrinkled, having the epidermis separating, as if it were transversely. Branches white. Lobes of calyx 5, roundish, deciduous, rather irregular. Fruit unknown.

Blackish Myrcia. Sh. 4 to 8 ft.

30 M. banisteriefolia (D. C. L. c.) peduncles axillary, opposite, twice trifid, a little shorter than the leaves; leaves elliptic, bluish, membranous, opaque, glabrous above, but villous beneath from adpressed rufescent down, as well as the branches, peduncles, and flowers. $\frac{1}{2}$ S. Native of Brazil, in fields near Yta, in the province of St. Paul. Myr'tus banisteriefolia, Mart. herb. Leaves an inch and a half long, and 9 lines broad, of an obscure green. Flowers small, 5-cleft. Fruit unknown.

Banisteria-leaved Myrcia. Sh. 4 to 6 ft.

31 M. palustris (D. C. L. c.) peduncles axillary, panicked, longer than the leaves; flowers crowded at the tops of the branches, and as well as the bracteas down; leaves oval, cuneated at the base, obtuse, opaque, glabrous above, paler beneath and dotted, puberulous on the nerves. $\frac{1}{2}$ S. Native of Brazil, in marshes in the province of St. Paul. Myr'tus palis'tris, Mart. herb. Leaves an inch and a half long and an inch broad. Petioles 2 lines long. Panicle 2 lines long, pubescent. Lobes of calyx 5, obtuse. Habit almost of M. banisteriefolia.

Marsh Myrcia. Sh. 4 to 6 ft.

32 M. hebepe'tala (D. C. L. c.) peduncles axillary, nearly terminal, racemously panicked, and as well as the calyces and branches hairy; calyx bluntly 5-lobed; leaves oblong, somewhat acuminate, with a few pehlcidic dots, clothed with adpressed, silky down in the young state, but glabrous above and rather hairy beneath in the adult state. $\frac{1}{2}$ S. Native of Brazil. Myr'tus pseudo-caryophyllus, Gomez? ex herb. Mart. Leaves 5 inches long and an inch broad. Petiole 3 lines long. Flower-bud globose. Petals pubescent on the outside. Fruit unknown.

Hairy-petalled Myrcia. Sh. 4 to 8 ft.

33 M. erioc'lyx (D. C. prod. 3. p. 247) peduncles axillary, racemose, panicked, longer than the leaves, and are as well as the peduncles clothed with vellutey villis; caly'x 5-cleft, very villous; leaves elliptic, oblong, with revolute margins, rather coriaceous, opaque, glabrous above, but velvety beneath. $\frac{1}{2}$ S. Native of Brazil, in woods in the district of the diamonds. Leaves an inch long and 5-6 lines broad, nerveless above, nerveless beneath: with 2 small, nearly abortive ovules, produced from the axils of the racemes. Bracteas foliaceous, deciduous.

Woolly-calyxed Myrcia. Sh. 4 to 6 ft.

34 M. tube'scens (D. C. L. c.) peduncles axillary, panicked, rather shorter than the leaves, or longer; bracteas, calyxes, and young leaves clothed with adpressed, somewhat rufescent down: leaves oval, obtuse, full of pehlcidic dots while young; but opaque and glabrous on the upper surface, and clothed with rufescent down on the under surface in the adult state: lobes of calyx 5, obtuse. $\frac{1}{2}$ S. Native of Brazil, in elevated fields, in the province of Minas Geraes. Leaves 30 lines long, and 12 lines broad. Panicule 1$\frac{1}{2}$ to 3 inches long. Fruit unknown.

Pubescent Myrcia. Sh. 4 to 6 ft.

35 M. ? macrochilamys (D. C. L. c.) peduncles axillary, and nearly terminal, few-flowered; branches and bracteas clothed with vellutey tomentum; tube of calyx turbinate, shorter than the lobes, which are oblong; bracteole 2, inserted at the base of the calyx; leaves oval, obtuse, reticulately veined, when young rather villous, full of pehlcidic dots, but glabrous, stiff, and opaque in the adult state. $\frac{1}{2}$ S. Native of Brazil, in the desert of Bahia. Shrub 10 feet. Leaves pale, 18 lines long and 9 broad. Petioles 2-3 lines long. Peduncles 9-10 lines long. Flower-bud globose. Staminiferous torus broad. Fruit unknown.

Long-cloaked Myrcia. Sh. 10 ft.

36 M. rup'tipes (D. C. L. c.) peduncles axillary, longer than the leaves, and terminal, many-flowered, clothed with vellutey rufous down as well as the branches; calyx with a glabrous subglobose tube, and 5 ovate lobes, which are clothed with rufescent down: leaves oval, obtuse, full of pehlcidic dots when young, clothed with rufous villi on the nerve, but in the adult state glabrous on both surfaces. $\frac{1}{2}$ S. Native of Brazil, in the provinces of the mines. Myr'tus rup'tipes, Mart. herb. Leaves 2 inches long, and an inch broad. Petioles 2 lines long. Bracteas and bracteoles almost wanting. Bark usually separating from the epidermis, which is rufous.

Rufus-petioled Myrcia. Sh. 4 to 6 ft.

37 M. camp'stris (D. C. L. c.) peduncles panicked, many-flowered, axillary, and terminal, longer than the leaves; calyx and branches densely clothed with rufous down; bracteoles setaceous; leaves oval-oblong, with rather revolute margins, opaque, glabrous above, puberulous on the nerve beneath. $\frac{1}{2}$ S. Native of Brazil, in fields, in the provinces of the mines. Myr'tus camp'stris, Mart. herb. Very like M. rup'tipes, but differs in the leaves being narrower and in the bracteas being elongated. The leaves are sometimes disposed 3 in a whorl. Fruit unknown.

Field Myrcia. Sh. 4 to 6 ft.

38 M. schranki'ana (D. C. L. c.) peduncles axillary, twice or thrice longer than the leaves, rather pubescent, panicked, and rather corymbose at the apex; calyx with a glabrous tube, and 5 somewhat ciliated lobes; leaves oval, nearly sessile, full of pehlcidic dots when young, with the margin and nerve villous: but opaque and glabrous in the adult state; branches clothed
with rufous villi.  

**Sll.** S. Native of Brazil, in the province of Minas Geraes, in the desert called the Cerrao. Myrtus Schrankiana, Mart. herb. Leaves 10-12 lines long, and 4-5 broad. A shrub 3-4 feet high, with dense branches. Peduncles 2 inches long. Lobes of calyx obtuse. Fruit unknown.

**Schrank's Myrica.** Sh. to 4 ft.

32. Myrica exsiccata (D. C. L. c.) peduncles axillary and terminal, panicked, longer than the leaves; bracteas and calyces ciliated while young; leaves elliptic or obovate, obtuse, membranous, full of pellicid dots, glabrous except on the nerves, margins, and petioles, which are rather puberulous; branchlets puberulous.  

**Cordifolia.** F. S. Native of Brazil, in fields. Myrtus Dutart and M. exsiccata, Mart. herb. Leaves pale, an inch and a half long, 8-10 lines broad. Fruit unknown.

**Dry Myrica.** Sh. 4 to 6 ft.

40. M. leucophila (D. C. L. c.) leaves ovate, acute, with a few pellicid dots, glabrous; peduncles axillary, and nearly terminal, racemose panically panicked, shorter than the leaves, and as well as the buds clothed with rufous velvety down; flower-buds obovate, small, glabrous; lobes of calyx 5, very short.  

**S.** Native of Brazil, in the province of Bahia, in woods. Myrtus leucophila, Mart. herb. Branches white, separating from the epidermis. Leaves 3 inches long, and half an inch broad. Petioles 2-3 lines long. Racemes 13 lines long. Fruit small.

**White-juiced Myrica.** Sh. 4 to 6 ft.

41. M. Lankiana (D. C. prod. 3. p. 218.) peduncles axillary, nearly terminal, panicked, shorter than the leaves, and are as well as the branches clothed with soft velvety vili; calyx with a villous tube, and 5 roundish, smoothish lobes; leaves obovate, acuminate, full of pellicid dots, membranous, narrowed at the base, with the margins revolute, glabrous above, but clothed with soft velvety down beneath.  

**S.** Native of Brazil, in woods in the province of Rio Janeiro, near Retiro. Myrtus Lankiana, Mart. herb. Leaves 3-4 inches long and 10-17 lines broad. Flowers small. Bracteas small, deciduous.

**Link's Myrica.** Sh. 4 to 6 ft.

42. M. spring (D. C. L. c.) panicles axillary, a little shorter than the leaves, many-flowered, densely clothed with velvety shortomentum, as well as the calyces, bracteas, and young leaves; lobes of calyx 5, obtuse; leaves ovato-oblong, acuminate, stiff, opaque, rilecately veined, in the adult glabrous above, and velvety beneath; branchlets somewhat compressed.  

**S.** Native of Brazil, in the province of Minas Geraes, in the desert. Leaves pale, 4 inches long, and 1½ and 2 inches broad, on short velvety petioles. A beautiful tree, about 30 feet high.

**Choice Myrica.** Tr. 30 ft.

43. M. cordifolia (D. C. L. c.) peduncles axillary and nearly terminal, panically panicked, shorter than the leaves, hairy; calyx clothed with silky villi, with 5 very blunt lobes; leaves ovate, obtuse, opaque, stiff, glabrous above, and a little blistered, velvety beneath; with the nerves reticulate, very prominent, and arculate.  

**S.** Native of Brazil, in the province of St. Paul. Myrtus cordifolia, Mart. herb. Leaves bluntest at the base, 9 inches long and 4-5 inches broad. Petioles 7 lines long. Flower-bud globose, downy. Bark of the branches rufous. Fruit unknown.

**Var. minor;** leaves acutish, one half smaller than those of the species.

**Heart-leaved Myrica.** Shrub.

44. M. vestita (D. C. L. c.) panicle terminal, branched, manyflowered; branches, bracteas, and calyces, densely clothed with tomentum; calyceae lobes 5, obtuse; leaves elliptic, acutish, almost sessile, opaque above, and rather villous, but densely clothed with hoary tomentum beneath, opposite or alternate.  

**S.** Native of Brazil, in the provinces of the mines, in ele-
terminal panicle, and are, as well as the branches and calyces, glabrous; limb of calyx 5-parted, short, deciduous; fruit globose, 2-3-seeded; leaves oval, bluntly acuminate, attenuated at the base, coriaceous, opaque, quite glabrous, smooth above. S. Native of Brazil, in the province of Maragogi. Myrtus Marag-nana, Mart. herb. Leaves 24-28 lines long, and 8-9 lines broad, standing on petioles 1-2 lines long. Panicle hardly longer than the leaves.

**Maragon Myrica.** Shrub. 51 M. *septaria* (D. C. l. c.) panicles axillary and terminal, many-flowered; peduncles compressed, rather pubescent, longer than the leaves; calyceae lobes obtuse; leaves oval-oblong, bluntly acuminate, stiff, with a few scattered, pellucid dots, shining above, and glabrous on both surfaces, as well as the branchlets. S. Native of Brazil, in the province of Bahia. Myrtus septaria, Mart. herb. Leaves 24-28 lines long, and 8-9 lines broad, standing on petioles 1-2 lines long. Lower peduncles 2 inches long, all near together, so as to form a terminal panicle. Bracteas small, obtuse, pubescent as well as the calyces, when young.

**Hedge Myrica.** Shrub. 52 M. *littoralis* (D. C. l. c.) panicles axillary and terminal, many-flowered, longer than the leaves, clothed with adpressed pubescence; calyceae lobes white within; calyceae lobes very short, hardly distinct, obtuse, at length spreading; leaves oval, obtuse, opaque, stiffish, nearly veinless, except the middle nervé, glabrous on both surfaces in the adult state, but rather downy when young, as well as the branchlets. S. Native of Brazil, in the province of Bahia, among bushes. Myrtus littoralis, Mart. herb. Leaves nearly 2 inches long, and an inch broad. Petioles hardly a line long. Branches compressed, but in the adult state terete and white.

**Shore Myrica.** Shrub. 53 M. *pubiflora* (D. C. l. c.) peduncles axillary and nearly terminal, compressed, longer than the leaves, disposed in a branched panicle at the apex, downy as well as the flowers; leaves elliptic, somewhat oblong, obtuse, coriaceous, opaque, glabrous on both surfaces in the adult state, but when young downy beneath; branches pubescently villous. S. Native of Brazil, on the mountains in the province of the mines, at Serro Frío. Branches naked, in consequence of the epidermis being deciduous. Leaves 2 1/2 inches long and an inch broad. Bracteas pubescent, concave, deciduous. Flower-bud hairy, nearly globose. Calyx 5-cleft in the young state. Fruit unknown.

**Downy-flowered Myrica.** Shrub. 54 M. *hirtiflora* (D. C. l. c.) peduncles axillary or terminal, opposite, and disposed in a terminal panicle; bracteas and calyces very hairy; calyceae lobes short, acute; petals glabrous; leaves elliptic-oblong, bluntly and shortly acuminate at the apex, membranous, full of pellucid dots, glabrous on both surfaces as well as the branches. S. Native of Brazil, in the province of Bahia, on the high mountain called Serra das Lages. Leaves about 3 inches long and 15-18 lines broad. Petioles 2 lines long. Fruit unknown.

**Hairy-flowered Myrica.** Shrub. 55 M. *casiminoide* (D. C. l. c.) peduncles axillary and nearly terminal, racemose, clothed with velvety tomentum, longer than the leaves; fruit globose, pubescent, crowned by the lobes of the calyx, which are rather villous, very obuse and connivent; leaves elliptic or oblong, obtuse, stiff, opaque, crowded, clothed with velvety villi on both surfaces when young, as well as the branchlets, but glabrous on the upper surface in the adult state. S. Native of Brazil, in the provinces of the mines. Leaves glabrous, rather rufescent when young, from 1-2 inches long, and 9-10 lines broad. Fruit the size of a pea. Seeds 2-3. Cotyledons corrugated.

**Cassine-like Myrica.** Tr. 10 to 15 ft. 56 M. *venelosa* (D. C. prod. 3 p. 250.) peduncles axillary or terminal, panicled, velvety, longer than the leaves; fruit globose, glabrous, rather pubescent; calyceae lobes broad, obtuse, short; leaves oblong, bluish, somewhat cuneated at the base, opaque, reticulately veined on both surfaces, glabrous, and shining above, but clothed with dense, short, velvety tomentum beneath, as well as on the branchlets. S. Native of Brazil, in the province of St. Paul. Myrtus venelosa, Mart. herb. Leaves an inch and a half long and 5-6 lines broad. Peduncles 2 inches long. Fruit the size of a pea, within the bearded limb of the calyx. Seeds 2. Cotyledons corrugated.

**Var. B., Capetotinésis** (D. C. l. c.) leaves elliptic-oblong, less reticulately than in the species, and the fruit is less rufescent. S. Native of Brazil, in Cape Cova. Perhaps a proper species.

**Teeny-leaved Myrica.** Shrub. 57 M. *eleodeendra* (D. C. l. c.) peduncles axillary, and nearly terminal, racemose pubescent, pubescent when young, about equal in length to the leaves; calyceae lobes 5, very blunt, smoothish; leaves oblong-lanceolate, obtuse, full of pellucid dots, rather stiffer, glabrous on both surfaces; peduncles and branchlets densely clothed with soft rufescent down. S. Native of Brazil. A tree 15-20 feet high, with loose, spreading branches. Leaves pale, rather glaucous, 2 inches long, and 9-10 lines broad. Flowers distant on the racemes. Lower branches of peduncle 5-flowered, upper ones 1-flowered. Fruit unknown. Eleodeendra-monmyrica. Tr. 15 to 20 ft.

58 M. *torita* (D. C. l. c.) peduncles axillary, racemose, 7-9-flowered, length of leaves, nearly bractless; fruit globose, crowned by the lobes of the calyx, which are short and roundish; leaves oblong, obtuse, full of pellucid dots, somewhat attenuated at the base, and glabrous on both surfaces, as well as the branchlets. S. Native of Brazil, on Serra Branca. Myrtus torita, Mart. herb. Leaves 2 inches long, and 9 lines broad, standing on petioles 1-2 lines long. Racemes an inch and a half long. Fruit glabrous, dark purple, shining. A tree 10-12 feet high, with twisted branches. Bark thick, greyish, chinky.

**Twisted Myrica.** Tr. 10 to 12 ft. 59 M. *subalpestris* (D. C. l. c.) peduncles axillary and nearly terminal, racemose pubescent, longer than the leaves, glabrous; fruit globose, crowned by the lobes of the calyx, which are short, obtuse, and conserver; leaves elliptic-oblong, obtuse at both ends, opaque, stiffish, glabrous above, but velvety from short tomentum beneath. S. Native of Brazil, in the provinces of the mines. Myrtus subalpestris, Mart. herb. Shrub 3 feet. Branches erect, terete. Fruit black, glabrous. Seeds 2, with a smooth testa. Cotyledons corrugated. Fruit unknown.

**Alp Myrica.** Shrub 3 feet. 60 M. *myrtillophila* (D. C. l. c.) peduncles axillary, longer than the leaves, paniculately coriaceous, few-flowered, and are as well as the calyces glabrous; bracteoles nearly wanting; branchlets rather pubescent; leaves oval, coriaceous, pale, glabrous, full of pellucid dots when young, reticulately veined beneath, smoothish in the adult state, opaque, and therefore dotted. S. Native of Brazil, in the province of Bahia. Myrtus myrtillophila, Mart. herb. Very like M. ramulosa, but differs in the leaves being more coriaceous, pale; in the racemes being more crowded and coriaceous, with hardly any bracteoles.

**Myrtle-leaved Myrica.** Tr. 20 to 30 ft. 61 M. *ramulosa* (D. C. l. c.) racemose axillary, 3-5-flowered, about the length of the leaves; bracteoles sessaceous, under the pedicels, and shorter than them; calyceae lobes short; leaves oval, full of pellucid dots, membranous, reticulately veined, glabrous, but rather villous on the nerve beneath, and on the margins and petioles; branches compressed, clothed with velvety
hairs beneath. ã. S. Native of Brazil. Myrtus virgúlósâ, Mart. herb. but not of Swartz. Flowers small, glabrous. Fruit unknown. Leaves 5-6 lines long, 4-5 lines broad.

Ferr. ã. undifíia (D. C. L. c.) racemes panicked, 12-20-flowered, longer than the leaves. Perhaps distinct from var. a. 

Branched Myricia. Sh. 4 to 6 ft.

65 M. Amazóncica (D. C. L. c.) peduncles shorter than the leaves, rather hairy, panicked, one-half shorter than the leaves, rather hairy; fruit ovate-globose, smoothish, crowded by the lobes of the calyx, which are small and bluntish; leaves sessile, ovate, obtuse at the base and somewhat cordate, acuminate at the apex, full of pellucid dots; lateral nerves at equal distances, and blistered between the veins: middle nerve hispid beneath; branchlets 2-edged, rather hairy. ã. S. Native of Brazil, on the banks of the river Amazon. Myrtus Amazónica, Mart. herb. Leaves nearly 3 inches long and 1 broad; petioles 2 lines long. Fruit 1-seeded, and globose; 2-seeded and somewhat didymous; or 3-seeded and bluntly 3-sided. Seeds with a smooth testa. Cotyledons corrugated. Flowers unknown.

Amazon Myricia. Sh. 4 to 6 ft.

66 M. fenestrâta (D. C. prod. 3. p. 251.) peduncles axillary, rather panicked, one-half shorter than the leaves, rather hairy; fruit ovate-globose, smoothish, crowded by the lobes of the calyx, which are small and bluntish; leaves sessile, ovate, obtuse at the base and somewhat cordate, acuminate at the apex, full of pellucid dots; lateral nerves at equal distances, and blistered between the veins: middle nerve hispid beneath; branchlets 2-edged, rather hairy. ã. S. Native of Brazil. Allied to M. fenestrâta, but the branches are not 2-edged, and the leaves are one half narrower, nearly all glabrous, or bearing small pili on the nerves beneath. Flowers nearly of M. pseudo-mini. Fruit unknown.

Pertusa-leaved Myricia. Sh. 4 to 6 ft.

67 M. leucopeâdro (D. C. prod. 3. p. 251.) peduncles axillary, and nearly terminal, panicked, clothed with minute, adpressed pubescence, equal in length to the leaves; calycine lobes glabrous, roundish, rather irregular; leaves ovate-oblong, somewhat acuminate, membranous, full of pellucid dots, rather puberulent when young as well as the branchlets, but glabrous in the adult state. ã. S. Native of Brazil. A tree 30 feet high, with the bark of the branches white. Leaves 2½ inches long, 9-10 lines broad. Petioles 1-2 lines long. Flowers almost of M. nigréscens. Fruit unknown.

White-tree Myricia. Tr. 30 ft.

68 M. sphërocaâpa (D. C. L. c.) peduncles axillary, cymosely panicked, a little longer than the leaves; fruit globose, crowned by the lobes of the calyx, which are short and obtuse; leaves elliptic, cuneate at the base, bluntly acuminate at the apex, full of pellucid dots, quite glabrous on both surfaces, as well as the branchlets and panicles. ã. S. Native of Brazil. Habit of Eugenia Candolleáea, but differs in the peduncles being longer, in the fruit being globose, and in the flowers being 5-cleft. Leaves nearly 2 inches long and 8-9 lines broad; petioles 2 lines long. Fruit one half smaller than a pea.

Round-fruited Myricia. Sh. 4 to 6 ft.

69 M. oblongâta (D. C. L. c.) peduncles axillary, longer than the leaves, panicked at the apex, smoothish; calyx of calyx small, roundish; fruit globose; leaves oblong, obtuse, coriaceous, with a few pellucid dots, and are as well as the branchlets quite glabrous; lateral nerves almost wanting. ã. S. Native of Brazil, in woods, in the province of St. Paul. Myrtus oblongata, Mart. herb. Very nearly allied to M. spheroacarpa, and M. elegans. Flowers unknown. Leaves nearly 2 inches long and 6 lines broad. Floral leaves hardly an inch long. Seeds with a smooth testa. Cotyledons contortuplicate.

Oblong Myricia. Tree.

68 M. elegâns (D. C. L. c.) panicles axillary and terminal, loose, twice the length of the leaves, and are as well as the flowers glabrous; bracteas linear-oblong; bracteoles almost wanting; fruit globose, crowned by the lobes of the calyx, which are short and obtuse; leaves ovate, obtuse, and stiffish, and are as well as the branches glabrous, beset with impressed dots on the upper surface, when young pilose. ã. S. Native of Brazil, in the province of Para. Myrtus elegans, Mart. herb. Leaves 2 inches long, 10-14 lines broad. Petioles 2 inches long. Flowers small. Fruit size of a pea. Seeds 2. Cotyledons corrugated. Allied to M. Amazónica.
Native of Brazil, in the provinces of the mines. Eugenia Mini var. is a shrub. Intermediate between M. pseudominis and M. multiflora. Inflorescence of M. multiflora, but rather downy.

Fruit unknown.

*Fer. B. pascuflora* (D.C. 1. c.) leaves rather narrower; peduncles shorter, fewer-flowered. 7. S. Native of Brazil. Perhaps the same as Eugenia Mini? Marc. herb.

**Ambiguous Myrica**. Shrub.

74 M. psuedominis (D.C. 1. c.) peduncles axillary, opposite, panicled, longer than the leaves or shorter, calyx and buds villous; leaves elliptic-oblong, gradually acuminate, shining above, hardly reticulated, full of pellucid dots when examined by a lens; flowers small, 5-cleft. 7. S. Native of Brazil, at Rio Janeiro. Eugenia Mini. Marc. herb. Very like the plant figured by Anquetil, but differs in the flowers being 5-cleft. Leaves hardly reticulated above, at length nearly smooth; lower ones small, roundish, shorter than the peduncles; upper ones longer, rather longer than the peduncles. Petioles 2 lines long. Fruit ovate-globose, blackish, 2-seeded, crowned by the lobes of the calyx, which are very blunt, and somewhat connivent. Seeds smooth. Cotyledons contortuplicate.

**False-mini Myrica**. Shrub.

75 M. corticiflora (D.C. 1. c.) terminal panicles, oppositely branched, subcorymbosse; bracteas and bracteoles almost wanting; leaves ovate, bluntly acuminate, opaque, quite glabrous, as well as the branches, panicles, and flowers. 7. S. Native of Brazil, at Rio Tapura. Leaves 3 inches long, and 15-18 lines broad. Petioles hardly 2 lines long. Flowers small, quinqued. Fruit unknown.

**Corobose-flowered Myrica**. Shrub.

76 M. lauritória (D.C. 1. c.) panicles axillary and nearly terminal, shorter than the leaves or longer, glabrous, as well as the flowers; bracteas linear-oblong; calyces lobes roundish; leaves ovate, obtuse, stiff, opaque, nearly veinless except the middle nerve, and are, as well as the branches, glabrous. 7. S. Native of Brazil, in the province of Pará. M. lauritória, Marc. herb. Leaves pale, 2 inches long, nearly one inch broad. Petioles 2 lines long. Flowers small. Fruit unknown.

**Laurel-leaved Myrica**. Shrub.

77 M. palvens (D.C. 1. c.) peduncles panicled, axillary and nearly terminal, rather longer than the leaves, and are, as well as the calyces and bracteas, glabrous; leaves oval, obtuse, at both ends, glabrous, glaucous, full of pellucid dots, as well as being dotted with brown beneath. 7. S. Native of Brazil, in the provinces of the Mines. Myrtus torta, Marc. herb. Leaves 9-10 lines long, and 5-6 lines broad, finely veined. Bracteas small, sectate; lobes of calyx obtuse. Shrub twisted, 10 feet high. Fruit unknown.

**Pale Myrica**. Shrub 10 ft.

78 M. decorticata (D.C. 1. c.) peduncles axillary and nearly terminal, rather longer than the leaves, panicled, rather hairy; lobes of calyx orbicular, white, and are, as well as the tube, glabrous; leaves ovate-elliptic, short-acuminate, full of pellucid dots when young, opaque stiffish and glabrous in the adult state; branchlets puberulent, separating from the epidermis. 7. S. Native of Brazil. Myrtus decorticata, Marc. herb. Leaves hardly acute, 3 inches long, and ½ inch broad, with somewhat revolute margins. Petioles 1-2 lines long, at length transversely suburnose. Petals 5, orbicular. Seeds 2, according to Martinus.

**Decorticated Myrica**. Tree 10 ft.

79 M. lasios (D.C. prod. 3. p. 253.) peduncles axillary and terminal, crowded into a panicle, many-flowered, longer than the leaves, and are, as well as the bracteas, hairy; calyces glabrous, bluntly 5-lobed; leaves ovate, obtuse at both ends, coriaceous, opaque, glabrous, as well as the branches. 7. S. Native of Brazil, in the field of the Mines. Eugenia lasios, Marc. herb. Allied to M. pubescens on the one hand, and to M. decorticata on the other. Leaves an inch and a half long. Petioles a line long. Small, crowded. Fruit unknown. There are various species of this species with very blunt, and acutish leaves, which are obtuse at the base, but hardly coriaceous.

**Hairy-peduncled Myrica**. Shrub 8 to 10 ft.

80 M. dubiuscula (Marc. herb. ex D.C. prod. 3. p. 253.) peduncles panicled, axillary and nearly terminal, rather shorter than the leaves, and are, as well as the bracteas, hispid; calyces glandular, glabrous, bluntly 5-lobed; leaves broad, ovate, obtuse at both ends, coriaceous, opaque, and are, as well as the branches, glabrous. 7. S. Native of Brazil, in the province of Bahia. Perhaps merely a variety of M. lasios, but the peduncles are shorter and less hairy.

**Hairy Myrica**. Shrub 8 to 10 ft.

81 M. prunifolia (D.C. 1. c.) peduncles supra-axillary, equal in length to the leaves or longer, panicled, and are, as well as the branches, clothed with soft hairs; calyces with a villous glabrous tube, and ovate ciliate spreading reflexed lobes; leaves oval or ovate or obovate, full of pellucid dots, membranous, glabrous on the upper surface in the adult state. 7. S. Native of Brazil, in the province of Minas Gerais. Myrtus prunifolia, Marc. herb. A very variable species, or many are confused under this name.

**Var. a., angustior** (D.C. 1. c.) leaves oval, attenuated at both ends; panicle villous, with its branches compressed and divaricating.

**Var. b., obovata** (D.C. 1. c.) leaves broadly ovate; panicle pubescent, sparingly branched, equal in length to the leaves; fruit glabrous, irregularly hollowed out into empty cells, but this is probably occasioned by insects.

**Var. c., ovata** (D.C. 1. c.) leaves broadly ovate, rather opaque; panicle hardly pubescent, longer than the leaves; fruit dillynious, globose. Seeds 5, with a brittle testa. Cotyledons contortuplicate.

**Plum-leaved Myrica**. Shrub.

82 M.? curatellœfloria (D.C. 1. c.) panicle corobose, nearly terminal; peduncles compressed, clothed with cernescent velvety down; fruit globose, velvety, crowned by the calyces lobes, which are short, broad, and spreading; leaves obovate, obtuse, somewhat cuneated at the base, membranous, opaque, smoothish above, and clothed with cernescent velvety down beneath. 7. S. Native of Brazil, in fields at Taubaté, in the province of St. Paul. Myrtus curatellofloria, Marc. herb. Fruit divided into many empty cells inside.

**Curatella-leaved Myrica**. Shrub 4 to 6 ft.

83 M.? pilosa (D.C. 1. c.) peduncles axillary, twice the length of the leaves, racemose or somewhat panicked, and are, as well as the branches and calyces, hairy; calyx with a glabrous tube, and ovate, acute, ciliated, spreading reflexed lobes; leaves oblong or somewhat ovate, rather opaque, clothed with villi when in a young state, but glabrous on the upper surface in the adult state, and velvety beneath, but at length smoothish. 7. S. Native of Brazil. Myrtus pilosa, Marc. herb. Fruit globose, crowned by the spreading calyx, divided inwardly into 15-20 compartments, some of them empty, and some of them filled with seeds. Seed with a hard testa. This species is very doubtful; it is probably a Myrtus or a Myricula, or a new genus, or the fruit is probably deformed by insects.

**Pilose Myrica**. Shrub 4 to 6 ft.

84 M. sericeæ; erect, much branched; leaves oblong, acuminate, glabrous above, and clothed with white silky down beneath, on short petioles; racemes panicked, axillary; peduncles and branches tomateose. 7. S. Native of Maranhão, in Brazil. **Silky Myrica**. Shrub 6 to 8 ft.
85. M. LEVIS; branched; leaves oblong, acuminate, glabrous on both surfaces; racemes panicled, terminal, and axillary. $\eta$. S. Native of Maranham, in Brazil.

**Smooth Myrcia.** Shrub 6 to 8 ft.

86. M. FERRUGINEA; branched; leaves oblong, acuminate, coriaceous, canescent above, rusty beneath; racemes panicled, axillary, and terminal. $\eta$. S. Native of Maranham, in Brazil.

**Rusty Myrcia.** Shrub 6 to 8 ft.

87. M. PUBESCENS; branched; leaves oblong, acuminate, pubescent above, and silky beneath; racemes panicled, axillary and terminal, pubescent. $\eta$. S. Native of Maranham, in Brazil.

**Pubescent Myrcia.** Shrub 4 to 6 ft.

88. M. ANGUSTA; leaves narrow, ovate-lanceolate, glabrous on both surfaces; racemes panicled, axillary and terminal. $\eta$. S. Native of Maranham, in Brazil.

**Narrow-leaved Myrcia.** Shrub 4 to 6 ft.

### b. Leaves sessile, cordate at the base.

89. M. SUBCORDATA (D. C. I. c.) peduncles compressed, axillary, nearly terminal, panicled, disposed in a kind of corymb, glabrous, as well as the calyxes; leaves sessile, bluntly cordate, broadly ovate, obtuse, coriaceous, opaque, glabrous on both surfaces in the adult state, but when young covered with deciduous down beneath. $\eta$. S. Native of Brazil, in the provinces of the Mines. Calyces lobes broad, obtuse, short. Fruit globose, crowned by the circular calyx. Seeds shining, very aromatic. Cotyledons contortuplicate. Leaves 12-15 lines long, and 10-12 lines broad. Flowers unknown.

**Subcordate-leaved Myrcia.** Shrub 3 to 4 ft.

90. M. VARIA-BILIS (D. C. prod. 3. p. 254.) peduncles axillary and nearly terminal, longer than the leaves, panicled, and are, as well as the branches, glabrous and somewhat compressed; leaves sessile, half stem-clasping, cordate, coriaceous, dotted, glabrous, reticulately veined, with the veins elevated on the upper surface. $\eta$. S. Native of Brazil, in the provinces of the Mines. Myrtus variabilis, Mart. herb. Calyces lobes broad, obtuse, glabrous. Allied to M. dealbata, and having its leaves and branchlets cloudy with white as in that species; and is perhaps merely a variety of it with different formed leaves.

**Var. a. ovatifolia** (Mart. herb.) leaves ovate-lanceolate, bluntly acuminate. $\eta$. S. Leaves an inch and a half long, and 8-9 lines broad.

**Var. b. intermedia** (Mart. herb.) leaves ovate, bluish. $\eta$. S. Leaves an inch long, and 6-7 lines broad.

**Var. c. nummularia** (D. C. I. c.) leaves nearly orbicular, somewhat emarginate at the apex. $\eta$. S. Leaves nearly an inch broad, and about the same in length.

### Variable Myrcia. Shrub.

91. M. DELABATA (D. C. I. c.) peduncle axillary and terminal, panicled, longer than the leaves, and are, as well as the bracts, glabrous, but sprinkled with white powder; leaves sessile, cordate, half stem-clasping, coriaceous, stiff, reticulately veined, glabrous, pale. $\eta$. S. Native of Brazil, in the province of Minas Geraes. Myrtus dealbata, Mart. herb. Leaves an inch long, and 8 lines broad, dotted. Calyces lobes broad, when young rather ciliated when examined by a lens, but at length glabrous, acutish. Petals roundish, glabrous. Inflorescence nearly as in M. caesicaca. Fruit unknown.

**White-delicate Myrcia.** Shrub.

92. M. RACEMULOSA (D. C. I. c.) peduncles axillary, racemose, twice the length of the leaves, 3-7-flowered, glabrous; branchlets hairy; leaves sessile, cordate, obtuse, coriaceous, quite glabrous, reticulately veined, dotted, rather opaque. $\eta$. S. Native of Brazil, in the provinces of the Mines. Myrtus race-

nulla, Mart. herb. Leaves 3-4 lines long, and 3 lines broad, margined by a nerve. Flowers small, glabrous. Calyces lobes short, broad, blunt, glaudulare. A very distinct species, with the habit of Be’ckeia. Inflorescence nearly as in M. ramula, Mart. herb.

**Racemulosa-flowered Myrcia.** Shrub 2 to 3 ft.

93. M. SCUTULIFERA (D. C. I. c.) peduncles axillary and nearly terminal, panicled, glabrous, many-flowered, 4 times the length of the leaves; leaves sessile, cordate-ovate, reticulately veined, coriaceous, opaque, glabrous; branchlets rather hairy. $\eta$. S. Native of Brazil, in the field in the provinces of the Mines. Myrtus scutellifera, Mart. herb. Very like M. racemulosa, but the flowers are more numerous but similar, the leaves are also similar, but longer, and the branchlets less hairy. It is probably only a variety of it.

**Scutellifera bearing Myrcia.** Shrub.

94. M. ALBO-TOMENTOSA (D. C. I. c.) peduncles axillary and nearly terminal, as well as the leaves, and are, as well as branches and bractae, hairy; calyces very hairy; leaves sessile, half stem-clasping, cordate, ovate, acutish, coriaceous, opaque, villous beneath, smooth and glabrous above. $\eta$. S. Native of Brazil, in the provinces of the Mines. Myrtus albo-tomentosa, Mart. herb. Leaves 3-8 lines long, and 7-9 lines broad, when young villous beneath. Calyces lobes blunt. Fruit unknown.

**White-tomentose Myrcia.** Shrub.

95. M. LASIA’STRIA (D. C. I. c.) peduncles axillary and nearly terminal, collected into a panicle, intermixed with leaves, and are, as well as the branchlets and calyces, very hairy; leaves sessile, half stem-clasping, cordate, ovate, acutish, coriaceous, opaque, villous beneath, smooth and glabrous above. $\eta$. S. Native of Brazil, in the provinces of the Mines. Myrtus lasiana, Mart. herb. Leaves 5-6 lines long, and 4-5 broad, crowded, somewhat reticulately veined, and villous on the upper surface. Panicle clothed with soft hairs, many-flowered. Calyces lobes broad, bluish. Fruit unknown.

**Withy-flowered Myrcia.** Shrub.

§ 2. Occápe (from oov, oon, an egg, and eppos, karpos, a fruit; in reference to the shape of the fruit). D. C. prod. 3. p. 254. **Fruit ovate or oblong.**

96. M. BE’BERIS (D. C. I. c.) peduncles panicked, axillary or terminal, shorter than the leaves; fruit oblong, rather elliptic, crowned by the short obtuse calyces; leaves elliptic, terminated in a long abrupt acumen each, coriaceous, when young full of pellucid dots, but in the adult state opaque, and shining above, quite glabrous on both surfaces, as well as the branchlets and pedicels. $\eta$. S. Native of Brazil, at the river Tapura; and of French Guiana. Myrtus Berberis, Mart. herb. Leaves 4 inches long, and hardly an inch and a half broad. Petioles 2-3 lines long. Pedicels 2-3 inches long. Bracteoles small, deciduous. Fruit 3 lines long, 1-seeded. Cotyledons corrugated.

**Berberry-like Myrcia.** Shrub.

97. M. FORMOSA’NA (D. C. prod. 3. p. 255.) peduncles panicked, rather shorter than the leaves, axillary or nearly terminal; fruit ovate, crowned by the lobes of the calyx, which are short and obtuse; leaves elliptic-oblong, gradually acuminate, coriaceous, opaque above, shining a little on both surfaces, and quite glabrous, as well as the pedicels and branchlets, which are compressed. $\eta$. S. Native of Brazil, in the province of St. Paul, in woods on the mountains. Very nearly allied to M. Berberis, but differs in the leaves being gradually, not abruptly acuminate, and in the fruit being more ovate. Seed one. Cotyledons corrugated.
MYRTACEÆ. XXVIII. MYRCIA.

98. Myrtus rostrata (D. C. I. c.) peduncles axillary, racemose, shorter than the leaves, 5-7-flowered; pedicels distant, opposite; calyx bluntly 5-lobed, clothed with adpressed down; fruit obovate; leaves lanceolate, much acuminate, full of pellucid dots, shining above and glabrous on both surfaces, as well as on the branchlets. f. S. Native of Brazil, in the province of St. Paul. Myrtus rostrata, Mart. herb. Leaves stiffish, 3 inches long, and 7-8 lines broad. Peduncles an inch long. Fruit 4 lines long, crowned by the calyx. Seeds unknown.

Beaked Myrtus. Tree 10 to 12 ft.

99. Myrtus eriopus (D. C. I. c.) peduncles panicled, axillary, a little longer than the leaves, and are, as well as the branches, hispid; tube of calyx oblong, hispid; leaves oval-oblong, acuminate, when young full of pellucid dots, clothed with long silky velvety down, opaque in the adult state, and smoothish. f. S. Native of Brazil, in the province of Rio Janeiro, in woods. Myrtus eriopus, Mart. herb. Leaves 1½ inch long, and 6 lines broad. Petioles 2 lines long. Calycin lobes short, obtuse.

Woolly-peduncled Myrtus. Shrub 8 to 10 ft.

*** Species natives of Columbia.

100. Myrcia umbellifera (D. C. prod. 3. p. 255.) peduncles 3-6-flowered, solitary or twin, or 2-4 seeded on a short common peduncle; flowers rather umbellate, with the middle one usually sessile; calyxes 5-cleft; leaves elliptic, obtuse at both ends, somewhat emarginate at the apex, coriaceous, reticulated, glabrous, rather silvery beneath; branchlets finely tomentose. f. S. Native of Cumaná, in cultivated places. Myrtus umbellifera, H. B. et Kunth, nov. gen. amer. 6. p. 186. Flowers about the size of those of *Crateres oxyacantha*. Stamin about 140 in number. Ovarium 2-3-celled; cells 4-6-ovulate. Fruit and seeds unknown.

Umbel-bearing Myrtus. Shrub.

101. M. clusifolia (D. C. I. c.) panicles axillary, depauperated, equal in length to the leaves; calyx 5-cleft; leaves elliptic, rounded at the apex, and sometimes emarginate, running down into the petioles, coriaceous, reticulated and shining, and are, as well as the branches, glabrous. f. S. Native of South America. Myrtus clusifolia, H. B. et Kunth, nov. gen. amer. 6. p. 188. Leaves about 2 inches long, and about 17-21 lines broad. Petioles 3-4 lines long. Fruit globose, about the size of a pea, few-seeded. Seeds unknown. Said to be like *M. timénta* and *M. coriacea*.

Clusia-leaved Myricia. Shrub.

102. M. polyáitha (D. C. I. c.) panicles axillary and terminal, branched; branchlets 1-3-flowered, compressed, clothed with fine silky down; leaves oblong, acuminate, acute at the base, obsolescently reticulated, coriaceous, glabrous above and shining, puberulous beneath, as well as on the branchlets. f. S. Native of South America, on the banks of the rivers Atalaba and Orinoco. Myrtus polyantha, H. B. et Kunth, nov. gen. amer. 6. p. 140. t. 545. Ovarium 2-celled; cells 2-ovulate. Fruit and seeds unknown.

Many-flowered Myricia. Shrub.

103. M. complicáta (D. C. I. c.) panicles axillary and terminal, branched; branchlets 1-3-flowered, compressed, clothed with fine silky down; leaves oblong, acuminate, rounded at the base, complicated, coriaceous, glabrous, shining, and are, as well as the branches, puberulous. f. S. Native of New Granada, at San Felipe. Myrtus complicáta, H. B. et Kunth, nov. gen. amer. 6. p. 141. Ovarium 2-celled; cells 2-ovulate as in *M. polyantha*. Said to be allied to *M. defléza* of Poir.

Complicated-leaved Myricia. Shrub 8 to 10 ft.

104. M. coccobotelófía (D. C. I. c.) panicles axillary, depauperated, compressed, glabrous, about equal in length to the leaves; calyx 4-5-cleft; leaves roundish-ovate, obtuse, rounded at the base, coriaceous, reticulated, shining, and are, as well as the branches, glabrous. f. S. Native of New Granada, near Ibagué. Myrtus coccobotelófía, H. B. et Kunth, nov. gen. amer. 6. p. 139. Flowers unknown. Berry nearly globose, glabrous, red, 3-celled, acid; cells few-seeded. Embryo like that of *M. braeclaris*.

Coccoloba-leaved Myricia. Shrub 5 ft.

105. M. bilardiána (D. C. I. c.) panicles axillary, panicled, glabrous, about equal in length to the leaves; flowers 5-lobed; leaves oblong, acuminate, acute at the base, of very short petioles, membranous, reticulated, glabrous. f. S. Native of New Andahab, on Mount Cocollar. Myrtus bilardiána, H. B. et Kunth, nov. gen. amer. 6. p. 139. t. 544. Flowers unknown. Berry nearly globose, 1-2-seeded. Cotyledons foliaceous, corrogated. Radicle long, descending. Calyx 4-lobed from the figure, but from the description 5-lobed.

La Billardier's Myricia. Shrub 10 to 12 ft.

Soft Myricia. Shrub 8 to 12 ft.

107. M. acuminâta (D. C. I. c.) panicles axillary, solitary and terminal, 5-angled, exceeding the leaves; calyx 4-5-cleft; leaves oblong-oblong, long-acuminated, obtuse at the base, reticulated, coriaceous, shining, pubescent on the nerve, when young silky. f. S. Native of New Granada, between Maripíta and St. Anna. Myrtus acuminâta, H. B. et Kunth, nov. gen. amer. 6. p. 141. Ovarium turbinate, 2-celled; cells 2-seeded. Embryo like that of *M. braeclaris*.

Acuminated-leaved Myricia. Shrub 8 to 10 ft.

108. M. humboldtiána (D. C. I. c.) panicles axillary, solitary, somewhat branched, divaricate, clothed with rusty tomentum, shorter than the leaves; calyxes 5-parted; leaves ovate-oblong, terminating in a narrow acumen, acute at the base, coriaceous, reticulated, shining, puberulous beneath; branches tomentose. f. S. Native on the banks of the Orinoco. Myrtus deltéxa, H. B. et Kunth, nov. gen. amer. 6. p. 142. Leaves 6-7 inches long, and 2 inches broad. Ovarium 2-celled; cells 2-seeded. In the immature seeds the cotyledons are foliaceous, complicated, and perhaps afterwards corrugated.

Humboldt's Myricia. Shrub 8 to 10 ft.

Xylopia-like Myricia. Shrub 8 to 10 ft.

Long-leaved Myricia. Shrub 8 to 10 ft.
**Uncertain species.**

111 M. melastomoides (D. C. l. c.) peduncles axillary, panicked, shorter than the leaves; leaves ovate, acute, strongly 3-nerved, sessile, very opaque and glabrous. ♂ S. Native of Tobago. Flowers 5-stalk. Margin of calyx permanent, usually 5-toothed. Fruit nearly globose, 1-seeded. Seeds large, shining. Cotyledons foliaceous, corrugated.

_Melastoma-like Myrica._ Shrub 5 to 10 ft.

112 M. ? triandra (D. C. l. c.) peduncles axillary, 3-5-flowered, shorter than the leaves; flowers 5-stalked, middle one sessile, lateral ones pedicellate; bracteas linear at the base of the calyx; leaves ovate-lanceolate, acute, full of pedullid dots; branchlets tetragonal, rather pubescent. ♂ S. 'Native country unknown. Leaves nearly of _M. communis var. Romana._ Lobes of calyx acute. Fruit and seeds unknown.

_Triangular Myrica._ Tree 10 to 15 ft.

113 M. ? vernicosa (D. C. l. c.) peduncles axillary, 3-5-flowered, a little longer than the leaves; calyx blunty and profoundly 5-toothed; leaves oval, obtuse at both ends, nearly sessile, shining on both surfaces, and as if they were varnished above; branches and peduncles glabrous. ♂ S. Native of South America. Leaves 20 lines long, and 12-14 broad, when young furnished with pedullid dots, but opaque in the adult state. Pedicels opposite, distant. Fruit and seeds unknown.

_Furnished-leaved Myrica._ Shrub 6 to 12 ft.

_Cult._ All the species of _Myrica_ are very like the common myrtle when in flower; they grow best in a mixture of loam, peat, and sand; and young cuttings will root readily if planted in a pot of sand, with a hand-glass over them.

_Lex. synx._ Icosandra, Monogynia._ Tube of calyx obsolete; limbus entire before flowering, but circumcised at the base at the time of flowering, constituting a deciduous operculum. Petals wanting, or 2 or 3 small. Stamens numerous; filaments capillary; anthers small, round, 2-celled. Style one. Stigma simple. Ovarium 2-3-celled; cells 2-seeded in the central angle. Berry 1-celled from abortion, 1-4-seeded.—Small trees, natives of the West Indies and Brazil. Leaves feather-veined. Pedicules axillary, many-flowered. Mature fruit as well known, but they are probably similar to those of _Myrica._

1 C. obscura (D. C. prod. 3. p. 257.) leaves oval, acuminate, stiff, shining above, full of pedullid dots beneath, quite glabrous, as well as the branches, on short pedicles; flowers 2-5 together, axillary, on short pedicles. ♂ S. Native of Brazil. Psidium obscurum, Mart. herb. Calyx with an obovate tube, having the limb irregularly ruptured after flowering. Allied to _C. rigidum._

_Obscura Calyptranthes._ Shrub.

2 C. nigida (Swartz, prod. p. 80. fl. ind. occ. p. 923.) arbori-scent; leaves oval, acute, convex, stiff, glabrous; peduncles axillary, simple, usually 3-flowered, glabrous. ♂ S. Native of Jamaica, on the higher mountains. Flowers small, white, nearly sessile on the tops of the peduncles. Berry minute, roundish, 1-seeded.

_Stiff Calyptranthes._ Tree 12 to 15 ft.

3 C. chytrandra (Swartz, prod. p. 79. fl. ind. occ. p. 921.) arborescent; leaves oval, at the apex, stiffish, glabrous; peduncles axillary and terminal, trichotomous, panicked, and are, as well as the flowers, clothed with rufous velvety down. ♂ S. Native of Jamaica, St. Thomas, and Guadaloupe, on the mountains. Chytrandra arborea, P. Browne, cam. 239. t. 37. f. 2. Myrtus chytrandra, Lin. amen. 5. p. 398. Flowers small, glomerate, white. Berry dry, 1-seeded. Eugenia paliens, Poit. suppl. 5. p. 122. The specific name is derived from _χυτρανθος_, a vessel, in reference to the operculum of the flower.

_Calyptranthes_ Calyptranthes. Fl. March, May. Clt. 1779. Tree. 4 C. szeygyum (Swartz, prod. p. 79. fl. ind. occ. p. 919.) arborescent; leaves ovate, obtuse, stiff; peduncles axillary, trichotomous, many-flowered, glabrous. ♂ S. Native of Jamaica, in arid calcareous places by the sea side. Suzygium fruticosum, Lin. amen. 5. p. 398. Flowers on short pedicles. Berry roundish, black, 3-4-seeded. The specific name is derived from _σευγυμ_, coupled, in reference to the manner in which the leaves are united in pairs.

5 C. martimana (D. C. l. c.) leaves oval, attenuated at the base, bluntish at the apex, rather opaque, having the lateral nerves confluent at their tops, reticulated, glabrous on both surfaces, as well as on the branches; peduncles compressed, trifid at the apex, with the ramifications bearing 3 sessile approximate, bibracteate flowers at the apex. ♂ S. Native of Brazil, in woods on the road to Felisbert. Leaves 4 inches long, and 2 inches broad. Peduncles diverging, 1½ inch long. Lateral pedicles 4 lines long, and the middle one 6 lines long. Bracteoles glabrous, deciduous. Calyx villous. Flower-bud ovate, acute, separating transversely into a conical operculum. Stamen numerous. Fruit unknown.

_Martim's Calyptranthes._ Tree.

6 C. eriopus (D. C. l. c.) leaves ovate, hardly petiolate, obtuse, coriaceous, opaque, glabrous; peduncles axillary, or nearly terminal, solitary or twin, a little branched, somewhat racemously spicate, shorter than the leaves, hairy from rufous villi; calyx villous; fruit globose, crowned by the neck of the calyx. ♂ S. Native of Brazil. Myrica eriopus, Mart. herb. Fruit like that of _Myrica_, but the calyx agrees with _Calyptranthes_. Leaves 15-18 lines long, and 10-12 lines broad.

_Wooly-footed Calyptranthes._ Tree.

7 C. pulchella (D. C. l. c.) leaves ovate, cuneate at the base, obtuse at the apex, coriaceous, dotted beneath, when young full of pedullid dots, glabrous on both surfaces, and on the branches; peduncles axillary, angular, a little shorter than the leaves, bearing 5-9 flowers. ♂ S. Native of Brazil, in the provinces of the Mines. Flowers 3, approximate on the tops of the peduncles. Flower-bud ovate, furnished with small rufous pili at the base. Leaves 15-16 lines long, and 7-9 lines broad.

_Pretty Calyptranthes._ Tree.

8 C. densa (D. C. l. c.) leaves oval, acutish at the base, stiff, opaque, and are, as well as the branches, glabrous; peduncles axillary and terminal, cordially pinnate, and are, as well as the branches, angular; fruit globose, crowned by the short truncate tube of the calyx. ♂ S. Native of Brazil, in the provinces of the Mines. Leaves nearly like those of _C. Chytrandra_, an inch long, and 6 lines broad. Fruit 2-seeded. Embryo pseudo-monocotyledonous. Flower-bud not seen.

_Dense-flowered Calyptranthes._ Tree.

9 C. concina (D. C. prod. 3. p. 258.) leaves elliptic-oblong, cuneate at the base, bluntish at the apex, full of pedullid dots, white from villi beneath, as well as on the branches, opaque in the adult state, and glabrous on both surfaces; peduncles axillary, opposite, bearing 3-5 flowers at the apex, in a kind of umbel. ♂ S. Native of Brazil. Leaves 2 inches long, 10 lines broad, nearly like those of _Myrica oblongata_. Peduncles
15 lines long. Flowers larger than any other of the species. Fruit unknown.

Neat Calyptranthes. Tree.

10. C. roricanus (D. C. L. c.) shrubby; leaves oblongate, obtuse, stiff, opaque, and are, as well as the branches, glabrous; peduncles axillary or terminal, equal in length to the leaves, somewhat panicked. \( \frac{T}{S} \). Native of Brazil. Leaves hardly petiolate, 2-3 inches long, and 15-18 lines broad. Flowers small. Flower-bud obvate, mucronate, blackish, as well as the whole plant.

Blackish Calyptranthes. Tree.

11. C. lornanthophila (D. C. L. c.) leaves elliptic, obtusely, rather coriaceous, opaque, clothed with adpressed pubescence, as well as the branchlets, but glabrous above; peduncles twin, opposite, panicked, rising from the base of the branchlets, and are, as well as the flowers, clothed with adpressed pubescent rufous down. \( \frac{T}{S} \). Native of Brazil, in fields in the province of St. Paulo. Leaves 2 inches long, and 15 lines broad. Petioles 2-3 lines long. Racemes 2 inches long. Flowers, and as if they were opaqued, from the bracteoles cohering at the apex.

Loranthaceo-leaved Calyptranthes. Tree.

12. C. cumipda (Mart. herb. ex D. C. prod. 3. p. 258.) leaves oval, narrowly acuminate, opaque, rather membranous, glabrous on both surfaces, as well as on the branch; peduncles axillary and terminal, loosely panicked, compressed, and are, as well as the calyxes, velvety from adpressed short rufous down. \( \frac{T}{S} \). Native of Brazil, in the province of Rio Negro, in woods. Leaves 6 inches long, and 2 inches broad. Panicle shortly than the leaves, usually much branched from the base. Flower-bud obovate, dotted. Fruit unknown.

Cuspidate Calyptranthes. Tree.

13. C. luinda (Mart. herb. ex D. C. L. c.) leaves elliptic-oblong, acuminate at both ends, petiolate, full of pellicled dots, glabrous on both surfaces, as well as on the branch; peduncles axillary, twin, panicked, a little shorter than the leaves, and are, as well as the calyxes, glabrous. \( \frac{T}{S} \). Native of Brazil, in the province of Bahia. A tree 20 feet high, with white bark. Branchlets angular. Leaves about 2 inches long, and 9 lines broad.

Shining Calyptranthes. Tree 20 ft.

14. C. aromatica (St. Hil. pl. usul. bras. t. 14.) shrubby; leaves oblong-oblongic, quite glabrous; peduncles axillary or terminal, twin, elongated, panicked. \( \frac{T}{S} \). Native of Brazil, in woods about Rio Janeiro. Petals 2-3, small, greenish. The flower-buds are whitish and aromatic, and are used in Brazil as a succedaneum for cloves. An oil might be obtained from them equal to oil of cloves.

Aromatic Calyptranthes. Shrub.

Panicled Calyptranthes. Shrub 10 to 12 ft.

16. C. lateriflora (D. C. prod. 3. p. 258.) spikes simple, arising from the old trunk or branches, villous; bracteas ovate, acute, concave, lower ones sessile; flowers sessile in the axis of the bractes; leaves oblong, acuminate, opaque, quite glabrous on both surfaces. \( \frac{T}{S} \). Native of Brazil, in the province of the Mines. Spikes 3-4 inches long, pedunculate, 11-15-flowered; flowers opposite, axillary, bipectate. Flower-bud nearly globose, very villous, at length ruptured at the apex, not 4-5lobed as in Myrurus and Eugenia; and not truly calyptraed as in Calyptranthes. Perhaps a new genus, but the expanded flowers, as well as the fruit, are unknown.

Side-flowering Calyptranthes. Tree 20 to 30 ft.

17. C. bullata (D. C. L. c.) branches minutely pubescent; leaves broad-lanceolate, obtuse, more or less blistered. \( \frac{T}{S} \). Native of Honduras. Myrurus bullata, Salisb. prod. 334. This species is hardly known.

Blistered Calyptranthes. Shrub 12 to 14 ft.

Calt. See Myrcia for culture and propagation, p. 847.

Lin. syst. Icosandra, Monogynium. Tube of calyx obvate; limb nearly entire or repandly lobed. Petals 4-5, roundish, jointed into a calyptra, and as if they were forming a convex membranous circumcised operculum. Stamens numerous, free. Style one; stigma simple. Ovarium 2-celled; cells few-ovulate. Berry 1-celled, 1 or few-seeded. Seeds globose. Cotyledons large, thick, half hemispherical. Radicle small, inserted beneath the middle of the cotyledons, and concealed by them. —Trees or shrubs, natives of the Old World within the tropics. Leaves opposite, glabrous. Peduncles axillary and terminal, cymose corymbose. This genus differs from Calyptranthes in the operculum being formed from the petals, not from the calyx; from Caryophyllus in the tube of the calyx being obvate or turbinate, not cylindrical, and with the lobes hardly distinct; and from Eugenia in the cotyledons being less closely conflucentuminated, and in the petals cohering into a calyptra.

\( \frac{1}{5} \). Fruit globose or subglobose.

1 S. guineense (D. C. prod. 3. p. 258.) leaves oblong-elliptic, acuminate at both ends, shining above and reticulated beneath; cymes trichoromatous, corymbose, terminal; calyx 5-toothed. \( \frac{T}{S} \). Native of Guinea and Senegal. Calyptranthes Guineenses, Wild. spec. 2. p. 274. This species is intermediate between Jamboua and Syzygium. Fruit unknown.

Guinea Syzygium. Tree.

2 S. latifolium (D. C. L. c.) leaves broadly ovate, obtuse at both ends, somewhat emarginate at the apex, coriaceous, reticulated, on very short petioles; flowers nearly sessile, in lateral fascicles. \( \frac{T}{S} \). Native of the Mauritius. Calyptranthes. Sieb. fl. marn. 2. no. 98. In this the leaves are 9 inches long and 5 broad.

Broad-leaved Syzygium. Tree.

Obovate-leaved Syzygium. Tree.

4 S. paniculatum (D. C. L. c.) leaves ovoid, acuminate, feather-nerved, silky; cymes numerous, rather crowded, disposed in a terminal panicle; calyx repand. \( \frac{T}{S} \). Native of the Island of Bourbon, where it is called Bais à écôre blanche. S. paniculatum, Garr. fruct. 1. p. 166, t. 33. ? Jamboliéfia péndula, Lin. ex Steud. Eugenia paniculata, Lam. dict. 3. p. 199. Branches with white bark. Petioles 5 lines long. Leaves 2 inches long, and an inch broad.

Panicled Syzygium. Tree.

5 S. cymosum (D. C. L. c.) leaves ovate-lanceolate, acuminate, hardly feather-nerved, coriaceous; cymes axillary and

Cymose-flowered Syzygium. Tree.

6 S. glomeratum (D. C. prod. 3. p. 259.) leaves ovate, obtuse, coriaceous, on very short petioles, reticulately veined, onercived; cymes nearly terminal, crowded with flowers, corymbose; calyx hardly repand. 7. S. Native of the Mauritis, where it is called Bois de pomme. Eugenia glomerata, Lam. dict. 3. p. 199. Myrtus glomerata, Spreng. no. 69. Myrtus coriacea, Sieb. fl. mar. 2. no. 102. and probably the Myrtus acris, Sieb. l. c. no. 101. exclusive of the synonyme of Swartz. Eugenia contracta, Poir. suppl. 3. p. 125.

Glomerated Syzygium. Tree.

Var. a; leaves acuminate. Eugenia Jambolana, Roxb. Var. b; leaves elliptic, tapering to both ends. Eugenia Jambolana, Roxb. and Rumph.

8 S. isophylla (D. C. prod. 3. p. 260.) leaves ovate-elliptic, acuminate at both ends, coriaceous, shining, reticulately veined; cymes axillary and terminal, corymbose; pedicels 3-flowered; flowers sessile; calyx quite entire. 7. S. Native of the East Indies. Eugenia isophylla, Roxb. hort. beng. no. 37.

Veiny-leaved Syzygium. Tree.

Close-leaved Syzygium. Cl. 1828. Tree.

10 S. nervosum (D. C. l. c.) leaves oval-elliptic, attenuated at the base, acuminate at the apex, rather coriaceous, feather-nerved, lateral nerves rather prominent; pedicels lateral and terminal, cymose panicked, loose; calyx quite entire. 7. S. Native of the Moluccaes. Eug. operculata, Roxb. hort. beng. p. 37.

Nerved-leaved Syzygium. Tree.

11 S. venosum (D. C. l. c.) leaves elliptic, cuneated at the base, acuminated at the apex, rather coriaceous; lateral veins nearly regular, forming a marginal vein in front of the margin; pedicels axillary and terminal, shorter than the leaves; calyx nearly entire. 7. S. Native of Nipaul. Petioles 8-9 lines long. Leaves 4 inches long and 1½ broad.

Veiny-leaved Syzygium. Tree.

12 S. Aekolatum (D. C. l. c.) leaves elliptic, cuneated at the base, acuminated at the apex, rather coriaceous, reticulately veined; areole regular at the margin, and as if they were constituting a double line; pedicels panicked, axillary and terminal, 3 or 4 times shorter than the leaves; calyx quite entire.

13 S. fruticosum (D. C. l. c.) shrubby; leaves elliptic-ovate, acuminated, rather coriaceous, feather-nerved; pedicels lateral, opposite or aggregate, loosely and corymbosely panicked. 7. S. Native of Chittagong, in the East Indies. Flowers small. Operculum almost as in the first section, wholly delilis, but corolline, obtuse, and marcescent. Eugenia fruticosa, Roxb. hort. beng. p. 37.

Shrubby Syzygium. Shrub 5 to 10 feet.

14 S. Caryophylleum (Garrn. frut. 1. p. 166. t. 33.) leaves ovate-oblong, bluish or emarginate, rather coriaceous, dotless; pedicels corymbose, corymbose, trichotomous, terminal.

Clove-like Syzygium. Tree.

15 S. Zeaylanticum (D. C. l. c.) arboreous; leaves ovate, acuminated, coriaceous, shining above, and full of impressed dots beneath; pedicels nearly terminal, corymbose panicked.

16 S. Specatum (D. C. l. c.) leaves ovate, acuminated, coriaceous, shining above, full of impressed dots; pedicels short, umbelliferous, crowded into a spicate ovate raceme; style exserted.

Spicata-flowered Syzygium. Tree.

17 S. odoratum (D. C. l. c.) leaves ovate-lanceolate, attenuated at the base, acute at the apex, rather coriaceous, dotless; pedicels terminal, cymose corymbose; berry globose, crowned by the limb of the calyx, which is very entire. 7. G. Native of Cochín-china, among bushes, and of China. Opa odorata, Lour. coch. p. 309. S. lucidum, Garrn. frut. 1. p. 167. t. 33.?

Sweet-scented Syzygium. Shrub 4 to 6 feet.

18 S. Racemosum (D. C. prod. 3. p. 261.) leaves oblong-lanceolate, acuminated, full of parallel veins; pedicels umbellulate, racemose, axillary or terminal; fruit globose. 7. S. Native of Java, on the mountains. Calyptranthus racemosus, Blum. bijdr. p. 1089.

Raceme-flowered Syzygium. Tree.

19 S. Laxiflorum (D. C. l. c.) leaves oblong-lanceolate, acuminated at both ends, full of transverse parallel veins; panicles terminal or axillary, divaricate; pedicels subumbellate. 7. S. Native of Java, in mountain woods. Calyptranthus laxiflorum, Blum. bijdr. p. 1090. Perhaps the same as S. Zeaylanticum.

Loose-flowered Syzygium. Tree.

20 S. Corymbosum (D. C. l. c.) leaves oblong-lanceolate, acuminated at both ends, veined; corymbose, terminal, divaricate; pedicels subumbellate; young branches ±-sided; fruit nearly globose. 7. S. Native of Java, on the mountains. Calyptranthus corymbosus, Blum. bijdr. p. 1091.

Corymbose Syzygium. Tree.

§ 2. Fruit oblong.

21 S. Pyrifolium (D. C. l. c.) leaves elliptic-lanceolate, bluntly acuminated, full of parallel veins; corymbs trichotomous, terminal; pedicels usually 3-flowered; fruit oblong.

5 Q.
**MYRTACEÆ. XXX. SYZYGIUM. XXXI. CARYOPHYLLUS.**

Every part of the plant is covered with minute dots or glands, which contain the oil, that gives the aromatic odour. It is not easy to determine when the clove was first known to Europeans. J. Bauhin tells us, that the inhabitants of the Moluccas were hardly acquainted with its value, till some Chinese vessels visited their country, and transported many plants into China, and that they were thus the means of distributing them into other districts of India, into Persia and Arabia. Sir James Smith (in Rees' cyc.) suspects it was brought into Greece from Arabia, and that the first distinct mention of it is made by Paulus Egina, a Greek physician of the seventh century, when it was used in food and in medicine; and the same author supposes it was the Charumel of Serapion, and the Charumel bellum of Avicenna, two Arabian physicians. The Moluccas being discovered by the Portuguese in 1511, and from that time, or very soon after, it may be imagined, that cloves came into common use in Europe. The clove is now cultivated in almost every part of Asia, where the soil and climate are suitable; and several of the West India Islands now possess this valuable vegetable, as St. Vincent, Trinidad, Martinique, St. Kitts, and other French Islands. The French have introduced it into Bourbon and the Mauritius, through the medium of M. Poivre, their then Intendent of those islands, who sent two vessels in 1769 to the kings of Gueby and Patony, to procure the clove and other valuable spices, which now succeed better in those islands than in Ambonya. Plants were sent from the Mauritius to Cayenne about the year 1779, and in 1792 the plantation there contained 2500 trees, which bore cloves equal to those of the East Indies, and fetched a higher price in France than those from the Moluccas.

The cloves of commerce are the unexpanded flowers, the corolla forming a ball or sphere on the top, between the teeth of the calyx; thus with the narrow base of the germ tapering downwards, giving the appearance of a nail; hence the Dutch call it nagel; the Spaniards clavo; the Italians chiodo; and the French clou, from which the English clove is derived.

The uses of cloves are sufficiently known, particularly in domestic economy, as a seasoning in various dishes, and to give flavour to wines and spirits. In medicine they are esteemed tonic and exhilarating, powerfully stimulating on the muscular fibres, but dangerous to bilious persons. These properties, and their acrid and burning taste, depend on the essential oil. Cloves yield, by distillation with water, about one-seventh of their weight of volatile oil. When the alcoholic extract is freed from the volatile oil by distillation with water, the oil that arises proves mild, and the resin that remains insipid. Its pungency, therefore, seems to depend upon a combination of these principles. The Dutch oil of cloves is extremely hot, fiery, and of a reddish brown colour, but is greatly adulterated both with fixed oils and resin of cloves; for the genuine oil, when recently distilled, is comparatively mild and colourless. It is
heavier than water, and rises in distillation with some difficulty. It is hot and caustic, and therefore employed in the cure of toothache. It is also employed by perfumers.

The cloves are gathered by hand, or beaten with reeds, so as to fall upon cloths which are placed under the trees to receive them, and dried by fire, or, what is better, in the sun. The fully-formed berries are preserved in sugar, and eaten after dinner, to promote digestion. Clove trees being difficult to transplant, the seeds are usually sown where the trees are intended to remain, for if the roots are once injured it is seldom they recover.

Aromatic or Common Clove. Clv. 1796. Tree 20 to 40 ft.

2 C. ellipiticus (Labill. sert. cale. p. 64. t. 68.) leaves ovate or elliptic, obtuse; cymes 3-flowered. | G. Native of New Caledonia.

**Elliptic-leaved Clove.** Shrub 3 to 4 feet.

3 C. antisepticum (Blum. in litt. ex D. C. prod. 3. p. 262.) leaves oblong-lanceolate, bluntly acuminate, full of fine pellucid veins; corollas axillary and terminal; pedicels umbraculate; calyx tubular, bluntly 5-toothed. | S. Native of Java, in the province of Buiten-Zorg, at Mount Pantjor. Calyptranthus aromatica, Blum. bijdr. p. 1092.

**Antiseptic Clove.** Tree.

4 C. fastigiatum (Blum. in litt. ex D. C. prod. 3. p. 262.) leaves cuneate-oblong, bluntish, full of fine, transverse, parallel veins; corollas terminal, fastigiate; pedicels 3-flowered. | S. Native of Java, in woods, in the western parts. Calyptranthus fastigiata, Blum. bijdr. p. 1090. This plant appears to be allied to Caryophyllus, in the calyx or ovary being cylindrical, and in the limb of the calyx being bluntly and evidently 4-lobed.

**Fastigiate Clove.** Tree 30 to 40 feet.

5 C. floribundus (Blum. in litt. ex D. C. l. c.) leaves ovado-oblong, bluntish. | S. Native of Java, in wood on Mount Salah. Calyptranthus floribundus, Blum. l. c. p. 1091. This is distinguished from the first species in the leaves being broader, stiffer, and in the corollas being divaricate and dense-flowered.

**Buddle-flowered Clove.** Tree 30 to 40 feet.

**Cult.** All the species of clove require a strong dry heat to flourish well, except C. ellipticus, which is a green-house plant. A mixture of loam and peat is the best soil for them. Ripened cuttings of them will root if planted in a pot of sand, with a handglass over them, in a moist heat. All the species are difficult to preserve through the winter in our stoves.

### XXXII. ACME'NA

(one of the names of Venus). D. C. dict. class. vol. xi. not. 1826. prod. 3. p. 262.

---

### XXXIII. EUGENIA

**Lin. syst. Icosandra, Monogyinia.** Tube of calyx roundish; limb 4-parted, even to the ovary. Petals 4. Stamens numerous, free. Ovarium 2-3-celled; cells many-ovulare. Berry nearly globose, crowded by the calyx, when mature 1-celled, but rarely 2-celled. Seeds 1-2, large, roundish. Embryo pseudo-monocotyledonous. Cotyledons very thick, and concentric. Radicle very short, hardly distinguishable. —Trees or shrubs, for the most part natives of the West Indies and South America. Leaves and inflorescence sometimes that of Myrtus and sometimes that of Myrica.

* Peduncles axillar, 1-flowered.

1 E. Michel'i (Laun. dict. 3. p. 203.) pedicels axillar, 1-flowered, usually solitary, shorter than the leaves; leaves ovato-lanceolate, glabrous; calyx 4-lobed; limb reflexed; berry torose. | S. Native of Brazil and about Demerara, also cultivated in Martinique, under the name of Ceriser de Cayenne. Jacq. obs. 3. p. 3. Eunigua, Mich. nov. gen. t. 108. Till. pl. t. 44. Myrtus Brasiliana, Lin. spec. p. 674. Plinia rubra, Lin. fil. suppl. p. 253. Curt. bot. mag. t. 473. Fruit edible, tubulose, adhering to the calyx. Cotyledons confertuplicate, ex Kunth. Perhaps the Plinia, Plunum, gen. t. 11, which is the Plinia pinnata of Lin. 735.

Michelü's Eugenia. Shrub 12 to 14 feet.

2 E. lioustrina (Wildl. spec. 2. p. 968.) pedicels 1-flowered, usually solitary, elongated, rising from the axils of the leaves or bracteas, bractless under the flowers; leaves lanceolate, obtuse, rather concave, shining above, glabrous on both surfaces, as well as on the flowers. | S. Native of the West Indies, Myrtus cerásina, Vahl. symb. 2. p. 57. Myrtus ligustrina, Szwartz, fl. ind. occ. p. 825. Fruit black, 2-seeded, crowned by the calyx. Embryo with confluent cotyledons.

**Pristis-like Eugenia.** Fl. Aug. Cl. 1798. Shrub 2 to 4 ft.

3 E. subterminalis (D. C. prod. 3. p. 262.) pedicels 1-flowered, solitary, rising from the axils of the upper leaves, opposite, slender, 3-times shorter than the leaves; bracteoles small, acute, 2 under each flower; fruit globose; calyxine lobes blunted; leaves oblong, acuminate at both ends, opaque, nervesless, and are as well as the branches glabrous. | S. Native of Brazil, at the river Ilhes. Leaves 2 inches long and 5 lines broad. Petioles 2 lines long. Pedicels 7-8 lines long.

**Subterminular Eugenia.** Shrub 4 to 6 feet.

4 E. Pia (D. C. l. c.) pedicels 1-flowered, solitary, elongated, rising from the axils of the bracteas and leaves; leaves lanceolate, bluntish, shining above, glabrous on both surfaces, as well as on the flowers; branches hairy. | S. Native of Brazil, in the province of Minas Geraes, at Serra de Piedado. Myrtus Pia, Mart. ind. Very like E. ligustrina, but the branches are

---
tomentose or hairy, and the fruit 4-seeded. Cotyledons con- 

terminate. Habit of *Myrtus.*

**Pia Eugenia.** Shrub 4 to 6 feet.

3 Sessilifolia (D. C. L. c.) pedicles axillary, solitary, 1- 

flowered, opposite, slender, bractless at the apex, 3-times shorter than the leaves; fruit globose, crowned by the calyceine lobes, which are oblong and acutish; leaves sessile, attenuated at both ends, oblong, full of pellucid dots, and are as well as the branches glabrous. T. S. Native of Brazil, in the province of Bahia. *Myrtus sessilifolia,* Mart. herb. Pedicels 2-3 inches long. Leaves 3 inches long and 1 inch broad. Seeds thick, pseudo-monocotyledinous.

**Sessile-leaved Eugenia.** Tree.

6 Sparseflora (D. C. L. c.) pedicles 1-flowered, solitary, 

one half shorter than the leaves, opposite, bractless at the apex, rising from the lower part of the branchlets, in the axis of the scales or leaves; fruit globose; leaves oval, acuminate, obtuse at the base, glabrous on both surfaces as well as the branches. T. S. Native of Brazil, near Almada, in the province of Bahia. *Myrtus sparseflora,* Mart. herb. Pedicels slender, 9 inches long. Calyceine lobes 4, oval. Leaves 3-4 inches long, and 15 lines broad. Petioles 4-5 lines long. Seeds unknown.

**Scattered-flowered Eugenia.** Tree 20 feet.

7 E. Laxa (D. C. L. c.) pedicles axillary, solitary, 1- 

flowered, very slender, shorter than the leaves; leaves oval, attenuated at the base, glabrous, acuminate at the apex; branchlets and young leaves clothed with rufous pubescence, but at length becoming glabrous; lobes of calyx 4, 2 larger and suborbicular; young fruit ovate. T. S. Native of Brazil, about Bahia, in the deserts. *Myrtus laxa,* Mart. herb. Pedicels 12-20 lines long, straight, rising from the axis of the upper leaves. Bracteas none, or very small. Leaves 3 inches long and 1 inch broad, full of pellucid dots. Immature fruit 1-seeded. Allied to *E. Patrisii,* but the fruit is ovate, not globose.

**Loose Eugenia.** Tree 10 to 20 feet.

8 Inocarpa (D. C. prod. 5. p. 264.) pedicles axillary, 1- 

flowered, shorter than the leaves; calyceine lobes 4, ovate; fruit globose, fibrinous inside, 2-seeded; leaves ovate, acuminate at the base, glabrous, acuminate at the apex, glabrous; branchlets clothed with rufous down, furnished with stipula-formed scales. T. S. Native of Brazil, on Rio Negro. *Myrtus inocarpus,* Mart. herb. Leaves 3 inches long and 1½ inch broad. Petioles short. Fruit full of tubercular dots, about the size of a plum, with fibrous, aci- 

d-sweet flesh. Pedicles few, 7 lines long. Seeds 2, convex on one side and flat on the other.

**Nerved-fruited Eugenia.** Tree 20 feet.

9 E. involucratA (D. C. L. c.) pedicles axillary, 1- 

flowered, with large, foliaceous, deciduous bracteas under 

the flower; floral leaves smaller than the rest; calyceine lobes 4, ovate-oblong, reflexed; leaves elliptic, petiolate, attenuated at both ends, when young rather villous and full of pellucid dots, but glabrous and opaque in the adult state; branchlets compressed. T. S. Native of Brazil. A small tree, with cren, spreading branches. Pedicles 5 lines long. Bracteoles 5 lines long. Sterile leaves 2 inches long. Petioles 4-5 lines long. Floral leaves smaller than the others.

**Involucrated-flowered Eugenia.** Shrub 6 to 8 feet.

10 E. bracteata (Rausch. nom. ex D. C. prod. 3. p. 264.) pedicles axillary, solitary, 1-flowered, bicracteate under the flowers, villous; leaves elliptic, obtuse, glabrous, when young clothed with appressed silky down; calyxes ciliolate. T. S. Native of the East Indies. *Myrtus bracteata,* Willd. spec. 2. p. 969. *Fruit and seeds unknown.

**Bicracteate-flowered Eugenia.** Cl. 1820. Shrub.

11 E. balsimica (Jacq. fragm. t. 45. f. 2.) pedicles lateral, 

solitary, 1-flowered, slender, rather villous, bearing 2 oval 

bracteoles under each flower; leaves ovate, bluntly acuminate, 

pale and dotted, glabrous; calyx rather villous. T. S. Native of Jamaica. *Myrtus balsimica,* Spreng. syst. 2 p. 481. Petals ciliolate, one half shorter than the stamens. Bracteas usually at the origin of the pericarps. Fruit and seeds unknown.

**Balsam Eugenia.** Cl. 1816. Tree 10 to 20 feet.

12 E. Pohliana (D. C. prod. 5. p. 264.) pedicles axillary, 

solitary, rather longer than the leaves, some 1-flowered, and 

others 3-flowered; middle flower sessile in the bifurcation, 2 

lateral ones pedicellate; bracteoles subulate; calyceine lobes 4, 

roundish, clothed with silky down on the outside, at length reflexed; leaves ovate, glaucous, dotted beneath, opaque, glabrous; petioles and branches clothed with rufous velvety down. T. S. Native of Brazil, in deserts, in the provinces of the mines. *Myrtus Pohliana,* Mart. herb. Allied to *E. Sellowiana* and *E. cina,* but in consequence of the pedicels being 1 or 3- 

flowered, it is an intermediate plant between the first and fourth sections. Leaves 9-10 lines long and 3 lines broad. Pedicules 10-11 lines long. Flowers about the size of those of *Myrtus communis.* Fruit unknown.

**Pohl's Eugenia.** Tree 20 feet.

13 E. Sellowiana (D. C. L. c.) pedicles axillary, solitary, 

1-flowered, bearing 2 subulate bracteoles; calyceine and branchlets clothed with velvety hoary down; leaves ovate-oblong, acuminate, full of pellucid dots, velvety above in the young, but in the adult state glabrous above, pubescent and reticulately nervet beneath. T. S. Native of Brazil, in the provinces of the mines, in the deserts. *Myrtus Sellowiana,* Mart. herb. A crooked tree, about 10 feet high. Leaves 2 inches long and 7-8 lines broad, spreading, not reflexed. Pedicels 4-10 lines long, rising from the axis of the upper leaves. Allied to *E. cina.*

**Sello's Eugenia.** Shrub 10 feet.

14 E. inodora (D. C. L. c.) pedicles axillary, solitary, 1- 

flowered, opposite, somewhat divaricate, bearing 2, subulate, rather alternate bracteas above the middle; calyx clothed with hoary velvety down; leaves ovate-oblong, acuminate, deflexed, opaque, when young pubescent above, but at length glabrous, and clothed with hoary velvety down beneath. T. S. Native of Brazil, in the provinces of the mines. *Myrtus inodora,* Mart. herb. Species allied to *E. Sellowiana,* but very distinct. Calyceine lobes ovate, obtuse, reflexed. Pedicels 6-7 lines long. Leaves an inch long; floral ones smaller.

**Hoary Eugenia.** Tree 10 to 15 feet.

15 E. rusea (D. C. L. c.) pedicles axillary, 1-flowered, 

shorter than the leaves, bearing 2 oblong bracteas under the flowers; branches, calyceine, and bracteas clothed with hairy tumetum; leaves oblong, attenuated at both ends, with revolute margins, smaller ones villous on both surfaces; adult ones glabrous above, but clothed with velvety tumetum beneath; lobes of calyx large, broadly ovate, obtuse. T. S. Native of Brazil, among rocks. *Psidium ruseum,* Mart. herb. A bush, with numerous procumbent branches. Flowers rose-coloured, 4-cleft, with a broad, staminiferous disk, as in *Psidium.* Leaves 2 inches long, and 4-7 lines broad. Pedicels 7 inches long. Fruit unknown.

**Rose-coloured-flowered Eugenia.** Shrub procumbent.

16 E. Kunthiana (D. C. L. c.) pedicles axillary, 1-flowered, 

3 times shorter than the leaves, bifracteate at the apex; ova- 
rimum ovate, small; calyceine lobes 8, obtuse, constriicted after flowering; leaves oblancoate, coriaceous, rather glaucous, glabrous, hardly with any pellucid dots; branchlets downy above. T. S. Native of Brazil. *Myrtus Kunthiana,* Mart. herb. Seed 1, elliptic-globose, pseudo-monecotyledonous. Pedicels 5-6 lines long.

Var. a; fruit red.

Var. β; fruit yellow.
MYRTACEAE. XXXIII. Eugenia.

583

Var. γ; leaves smaller; pedicels shorter, 2 lines long. /forms. Native of Brazil, in the province of Minas Gerais.

584

23 E. ? apiculata (Mart. ex. 3. p. 206.) pedicels axillary, solitary, 1-flowered, about 0.125 inch long and 0.1 inch broad, adpressed, very short pedicels; leaves oblong, acuminate, coriaceous, minutely punctate; veins albae at the base; petioles long, grooved, pubescent. Native of Jamaica, on the tops of the Blue Mountains. Myrtus rigida, Swartz, in herb. Lher. Myrtus alpina, Swartz, fl. ind. occ. p. 883. Berry dry, ovate, when mature 1-seeded. Seed oblong.

585

Alpine Eugenia. Shrub 4 to 6 feet.

24 E. willdenowii (D. C. I. c.) pedicels 1-flowered, filiform, axillary, or, in the axillary, or in the axillary, or axillary, bearing 2 subulate very short bracteas under the flowers; leaves oblong, acuminate, coriaceous, obtusely pointed, shining. Native of Cayenne. Said to be allied to E. mickelii and E. Parisii. Eugenia zeylanica, Willd. spec. 2. p. 963, but not of Roxb. Myrtus Willdenowii, Spreng. syst. 2. p. 480, exclusive of the var. from Porto Rico.

586

Willdenow's Eugenia. Tree.

25 E. obtusa (D. C. prod. 3. p. 266.) pedicels axillary, solitary, 1-flowered, a little shorter than the leaves; the bracteas under the flowers and the calyces are ovate-oblong and foliaceous; leaves oval, obtuse at both ends, glabrous, full of impressed dots on the upper surface, when young fleshy beneath, but at length pale; branches and pedicles clothed with rubious villi. Native of Peru. Myrtus obtusa, Juss. herb. Leaves 5-6 lines long and 3 lines broad. Flower nearly globose, 1-seeded. The bracteates are larger than those in the allied species. Habit of E. alpina, but the pedicels are longer, and the bracteates are much larger and permanent.

Blunt-leaved Eugenia. Shrub.

26 E. portoricensis (D. C. I. c.) pedicels 1-flowered, slender, shorter than the leaves, axillary or lateral, bearing 2 ovate, puberulous bracteates under the leaves; leaves ovate-elliptic, acuminate, membranous, dotted, as are as the branches glabrous; petals sub-cilicate, Native of Porto Rico, on the edges of woods. Eugenia latifolia, Spreng. in herb. Balb. Pedicels half an inch long, axillary, solitary, numerous, rising from the base of the branches in an irregular way. Bracteates small, scale-formed at the origin of the pedicels. Leaves nearly 3 inches long. Flowers small, glabrous. Ovarium globose. Fruit and seeds unknown.

Porto-Rico Eugenia. Tree.

27 E. prodromata (D. C. I. c.) pedicels 1-flowered, axillary, and lateral, solitary, or rather aggregate, naked, much shorter than the leaves; leaves coriaceous, quite glabrous, shining above, oval, drawn out into a long, linear, blunt acuminate each; calyx 4-cleft. Native of Cayenne. Leaves oval, 3-4 inches long, and 2 inches broad, terminating in an acuminate, which is an inch long and half a line and a half broad. Berry globose, 1-seeded. Seed thick. Cotyledons fleshy, coniferminated.

Drawn-out-leaved Eugenia. Shrub.

28 E. crassifolia (D. C. prod. 3. p. 266.) pedicels axillary, 1-2-flowered, very short, thickish; fruit globose, crowned by the lobes of the calyx, which are deciduous; leaves oblong, coriaceous, acuminate at both ends, glabrous above, but covered with hairy down beneath; petals as well as the branches rather velvety. Native of Brazil, in woods, in the province of St. Paul. Myrtus crassifolia, Mart. herb. Seed 1, thick, rather horny, pseudo-monocotyledonous. Leaves ½ inch long and an inch broad. Petioles longer than the pedicels.

Thick-leaved Eugenia. Shrub.

29 E. velissekertii (D. C. I. c.) pedicels solitary, very short, 1-flowered, opposite, rising from the axis of the small bracteate- formed leaves; bracteates large, under the flowers; calyx vil- lous, 4-cleft; leaves oblong, acuminate at both ends, full of pellicud dots, when young rather villous on both surfaces; nerves,
petioles, and branches clothed with adpressed villi. t| s. native of Brazil, in woods on the road to Felisbert. Myrthus Felisberti, Mart. herb. Leaves membranous, pale green, 4 inches long and an inch and a half broad. Petals roundish, hardly longer than the calyx. Stamens innumerable. Fruit unknown.

Felisberta Eugenia. Shrub.

30. E. parvifolia (D. C. l. c.) pedicels axillary, 1-flowered, a little shorter than the leaves; bracteoles small; leaves oblong-linear, obtuse, acute, marked by the nerve above, which is impressed, dotted beneath, the rest veinless and glabrous. t| s. native of Peru. Myrthus parvifolia, Juss. herb. Flowers small. Very like the following species, but the leaves are a little larger and not exactly linear, acute at the apex.

Small-leaved Eugenia. Shrub 2 to 3 feet.

31. E. leptospermoïdes (D. C. l. c.) pedicels axillary 1-flowered, a little shorter than the leaves; bracteoles small; leaves oblong-linear, obtuse, nearly nerveless, dotted, glabrous. t| s. native of chili and Peru. Leaves 4-5 lines long, and a line broad. Flowers small. Fruit and seeds unknown. It agrees with the figure of Feuill. obs. 3. t. 31 and is not unlike Myrthus Ungii. Myrthus parvifolia, Juss. herb.

Leptospermum-like Eugenia. Shrub 2 to 3 feet.

32. E. Pariisi (Vahl. ccl. amer. 2. p. 35.) pedicels 1-flowered, slender, axillary, solitary, and nearly terminal, in fours, naked under the flowers, bractless at the base; leaves elliptic, glabrous, acuminate at both ends. t| s. native of French Guiana. Myrthus Pariisi, Spreng. syst. 2. p. 480. Pedicels an inch and a half long; Bracteae acute, short. Fruit glabrous, not toborne. Staminiferous disk broad, nearly as in Psidium. Seeds very few. Cotyledons confluented? in the immature state. Allied to Myrthus ligustrina.

Patria's Eugenia. Tree.

33. E. nemorâlis (D. C. prod. 3. p. 267.) glabrous; pedicels axillary, 1-flowered, solitary, opposite, erect, equal in length to the petioles; bracteoles hardly any under the flowers; fruit elliptic; calyceae lobes 4, broad, obtuse; leaves elliptic, abrupt, and oppositely apiculated, coriaceous, opaque. t| s. native of Brazil. Myrthus nemorâlis, Mart. herb. Allied to E. clinocarpâ, but differs in the fruit being erect and twice the size. Leaves 2 inches long and an inch broad.

Grove Eugenia. Shrub.

34. E. clinocarpâ (D. C. l. c.) glabrous; pedicels axillary, 1-flowered, twice the length of the petioles, when in flower erect, and when in fruit deflexed; bracteoles small, under the flowers; fruit elliptic; lobes of calyx short, very blunt; leaves oval, rather oblong, attenuated at the base, obliquely acuminate at the apex, rather coriaceous, full of pellucid dots. t| s. native of Brazil, at the river Peruanaguas, in the province of Bahia, in woods. Myrthus clinocarpâ, Mart. herb. Leaves 15-18 lines long and 6-8 lines broad. Young branches somewhat tetragonal. Fruit 1-seeded. Cotyledons confluented.

Bed-fruited Eugenia. Shrub.

35. E. Brasileânis (Lam. dict. 3. p. 203.) pedicels 1-flowered, slender, rising from the axis of the scaly leaves, along the branches from velvety scaly buds; bracteoles none; calyceae lobes reflexed; leaves oval or obovate-oblong, bluish, coriaceous, quite glabrous. t| s. native of Brazil. Myrthus Dombejii, Spreng. syst. 2. p. 485.—E. brazeilâris, Lam. mss. in herb. Juss. Leaves shining above, 8 inches long, 1½ broad. Pedicels about equal in length to the floral leaves. Stamens hardly longer than the petals.

Brasilian Eugenia. Shrub.

36. E. reinwardtiana (D. C. l. c.) pedicels interpetiolar, 1-flowered, shorter than the leaves; leaves on short petioles, elliptic-oblong, bluish, coriaceous, remote, smoothish. t| s. native of the Moluccas. Myrthus reinwardtiana, Blum. bijdr.

p. 1058. Calyx 4-cleft. Fruit roundish, and with the seeds nearly as in Eugenia.

Reinwardt's Eugenia. Shrub.

37. E. Maranhaoënsis; branched; leaves oblong, coriaceous, acuminate, glabrous on both surfaces; pedicels axillary, 1-flowered. t| s. native of Maranhao, in Brazil.

Maranhao Eugenia. Shrub 4 to 8 feet.

38. E. myrtoides; branched; leaves ovate, quite entire, acute, coriaceous, almost sessile; pedicels axillary, 1-flowered. t| s. native of the western coast of Africa, on the Gold coast, particularly at acera.

Myrtle-like Eugenia. Shrub 4 to 8 feet.

* * *

39. E. punctifolâ (D. C. l. c.) pedicels axillary, 1-flowered, twin, much shorter than the leaves, bracteolate under the flowers; leaves oblong, obtuse, acute at the base, rather coriaceous, shining, and are as well as the branches glabrous; calyx 4-cleft. t| s. native near camana, on mount impossible. Myrthus punctifolâ, H. B. et Kunth, nov. gen. amer. 6. p. 149. Leaves 2 inches long. Flowers the size of those of Craeiâx ouxycânthâ. Ovarium 2-celled. Berry nearly globose, red, 1-2-seeded. Said to be allied to Myrthus ligustrina.

Pomegranate-leaved Eugenia. Shrub 10 to 12 feet.

40. E. vismostoides (D. C. l. c.) pedicels 1-3 together, axillary, 1-flowered, much shorter than the leaves, bracteolate, under the flowers; leaves ovate, cuneate at the base, on very short pedicles, bluntly attenuated at the apex, glabrous on both surfaces as well as on the branches, with a very few pellucid dots. t| s. native of the Moluccas. Pedicels 4 lines long. Flavour bud globose. Lobes of calyx very blunt, roundish. Leaves 3 inches long and 1½ broad.

Visinia-like Eugenia. Shrub 6 to 8 feet.

41. E. sanctâ (D. C. l. c.) pedicels 1-2 together, axillary, 1-flowered, 4 times shorter than the leaves, bracteolate under the flowers; leaves oval, almost sessile, bluish at both ends, stiff, full of minute pellucid dots, glabrous on both surfaces; branches rather pubescent. t| s. native of Brazil, in the province of Bahia, among bushes at the bottoms of the mountains. Myrthus sancta, Mart. herb. Leaves pale green, 15 lines long, and 8-9 lines broad. Pedicels 3-4 lines broad, and are as well as the calyces glabrous. Calyceae lobes very blunt. Style hooked at the apex. Fruit unknown.

Holy Eugenia. Shrub 2 to 3 feet.

42. E. coarensis (D. C. l. c.) pedicels 1-3 together, 1-flowered, 3 times shorter than the leaves; calyceae lobes 4, obtuse; leaves oval, nearly sessile, bluntly somewhat acuminate, stiff, opaque, and as well as the branches glabrous; lateral veins almost wanting. t| s. native of Brazil, at rio negro. Myrthus coarensis, Mart. herb. Leaves an inch long and 6 lines broad. Pedicels 2-3 lines long. Flowers small.

Coari Eugenia. Shrub.

43. E. Kochiana (D. C. prod. 3. p. 268.) pedicels 1-3 together, 1-flowered, 3-times shorter than the leaves, bracteolate at the apex; calyceae tube obvolute, with the lobes ovate; leaves oval-oblong, sessile, stiff, opaque, obtuse at both ends, almost veinless, and are as well as the oppositely tetragonal branchlets, glabrous. t| s. native of Brazil. Myrthus kochiana, Mart. herb. Leaves an inch long and 4 lines broad, erect. Nearly like those of Phyllirea media. Pedicels 4 lines long. Flowers small.

Koch's Eugenia. Tree 20 to 30 feet.

44. E. Stingmatosâ (D. C. l. c.) pedicels 1-3 together, axillary, 1-flowered, 3-times the length of the petioles, acutely bracteolate, under the flowers; leaves ovate, cuneate at the base, bluntly acuminate at the apex, glabrous, full of large pellucid
dois, which are rarely blackish beneath. ț. S. Native of Brazil, in the desert of Bahia. Myrtus stagnatosa, Mart. herb. Very nearly allied to E. dypoda. Pedicels 6 lines long. Leaves paler beneath, 2 inches long and an inch broad. Flowers small. Lobes of calyx roundish, reflexed; tube nearly globose. Fruit unknown.

Stigmatosa Eugenia. Tree.

45 E. dypoda (D. C. prod. 3. p. 268.) pedicels 1-flowered, axillary, twin, shorter than the leaves, bibracteolate under the flowers; leaves elliptic-oblong, attenuated at both ends, with an obtuse acumen, and are as well as the branches glabrous. ț. S. Native of French Guiana. Leaves 1½ inch long, and about the same in breadth, full of very minute pellucid dots. Pedicels 5 lines long. Berry ovate, 1-seeded. Cotyledons thick, coniform. Calycine lobes very blunt.

Var. brachypoda (D. C. l. c.) pedicels 3 lines long.

Two-pedicelled Eugenia. Shrub.

46 E. pedosa (Poir. suppl. 2. p. 129.) pedicels 1-flowered, axillary, 2-4 together, shorter than the leaves, bibracteolate under the flowers; leaves ovate, bluntly acuminate, and are as well as the branches glabrous. ț. S. Native of St. Domingo, in woods also of Martinique and Santa-Cruz. Myrtus prodera, Swartz, fl. ind. occ. p. 887. Branches twiggy. Leaves an inch and a half long. Petioles 3 lines long. Berry nearly globose, about the size of a pepper, 1-seeded. Cotyledons conformed. Fruit eatable.

Tall Eugenia. Tree 20 to 30 feet.

47 E. pseudopodium (Jacq. amer. 15. t. 93.) pedicels 1-flowered, shorter than the leaves, bibracteolate under the flowers, lower ones axillary, solitary, upper ones nearly terminal, in fascicles; leaves ovate, acute, and are as well as the branches glabrous; fruit smooth, globose. ț. S. Native of Martinico, in mountain woods, where it is called Goutayver (Sêdar). Myrtus pseudopodium, Spreng. syst. 2. p. 480. exclusive of the synonymes. Berry red, 1-seeded. Seed thick. Cotyledons conformed. Fruit eatable, and held in considerable esteem in the West Indies.

False-guava Eugenia. Tree 20 feet.

48 E. psidoides (D. C. prod. 3. p. 268.) pedicels thickish, axillary, 1-flowered, much shorter than the leaves, 4-8 in a fascicle, minutely bibracteolate under the flowers; leaves ovate, shortly acuminate, coriaceous, and with revolute margins, and are as well as the branches glabrous. ț. S. Native of Cayenne. Very like E. pseudopodium, but the leaves are more oval, and distinctly mucronately acuminate, coriaceous, with revolute edges; the pedicles are shorter, and hardly half an inch long. Fruit globose. Seed 1, large. Bracteoles small.

Guava-like Eugenia. Tree.

49 E. nora (D. C. l. c.) pedicels 3-4 together, axillary, 1-flowered, thickish, length of petioles; fruit globose; leaves oval, short-acuminate, coriaceous, opaque, shining above, glabrous on both surfaces, as well as on the branches. ț. S. Native of Brazil, in the province of Para near Ega. Myrtus nigra, Mart. herb. Branches terete. Leaves 5 inches long and 2 broad. Pedicels, when in fruit, hardly 3 lines long. Flowers unknown. Fruit half an inch in diameter. Calycine lobes deciduous, and therefore the fruit is marked with a somewhat tetragonal areola at the apex. Seeds 2, large.

Black Eugenia. Tree.

50 E. citriophila (Poir. suppl. 3. p. 129.) peduncles axillary, very short, branched; pedicels in fascicles, shorter than the petioles, bibracteolate under the flowers; leaves elliptic-oblong, acuminate, coriaceous, shining, and are as well as the branches quite glabrous. ț. S. Native of Cayenne. Myrtus Cayenensis, Spreng. syst. 2. p. 480. Fruit small, according to Poiret, globose, and 1-seeded. Leaves 5-6 inches long.

Citron-leaved Eugenia. Shrub.

51 E. dysenterica (D. C. prod. 3. p. 268.) pedicels axillary, solitary, 1-flowered, slender, shorter than the leaves, rather crowded on the short branches, branchless at the apex; calycine lobes ciliated, bearded at the apex; leaves ovate, obtuse, quite glabrous, on short petioles, rising with the flowers. ț. S. Native of Brazil, in fields about Guyaz, where it is called Cogesteira. Myrtus dysenterica, Mart. herb. trav. vol. 2. A twisted tree, leafless at the time of flowering. Branches glabrous, bearing 5-6 scales. Berry globose, depressed, furrowed, citron-coloured. Scales of buds ciliated.

Dysenteric Eugenia. Tree 10 to 20 feet.

52 E. martiusiana (D. C. prod. 3. p. 269.) pedicels 5-9 together, axillary, about the length of the petioles; bracteoles 2, obtuse, connate under the flowers; fruit globose, 3-seeded; calycine lobes 4, small, obtuse; leaves oval, bluntish at both ends, coriaceous, opaque, and are as well as the branchlets glabrous. ț. S. Native of Brazil, in woods of the province of Bahia. Myrtus Lindleyana, Mart. herb. but not of Kunth. Leaves about 3 inches long, and about 2 broad. Petioles 3 lines long. Fruit the size of a pea. Seeds compressed, somewhat reniform. Cotyledons conformed.

Martius's Eugenia. Tree.

53 E. longifolia (D. C. I. c.) pedicels 3-5 together, 1-flowered, a little shorter than the petioles, bibracteolate at the apex; calyx with an obovate, somewhat turbinate tube, and 4 obtuse lobes; leaves elliptic-oblong, acuminate at both ends, and are as well as the branches glabrous; lateral nerves running into a vein, which is distant from the margin. ț. S. Native of Brazil, in swampy shady places of woods, in the province of Bahia. Myrtus longifolia, Mart. herb. A loose tree, with expanded branches. Leaves 9 inches long and 2½ inches broad. Petioles 4 lines long. Pedicels 3 lines long. Flowers small. Fruit unknown.

Long-leaved Eugenia. Tree.

54 E. latifolia (Aubl. guian. 1. p. 502. t. 199.) pedicels axillary, usually tern, 1-flowered, length of the petioles, bibracteolate under the flowers; leaves broad-ovate, acute, reticulately veined, and are as well as the branches glabrous; fruit ovate. ț. S. Native of French Guiana, on the edges of fields. Myrtus latifolia, Spreng. syst. 2. p. 481. Leaves 10-11 inches long and 5-6 inches broad. Flowers white, sometimes 5-cleft, according to Aublet. Berry olive-formed, violaceous, 1-seeded. Seed thick.

Broad-leaved Eugenia. Clt. 1793. Shrub 6 to 7 feet.

55 E. undulata (Aubl. l. c. p. 508. t. 202.) pedicels axillary, usually 3-together, 1-flowered, rather shorter than the petioles, bibracteolate under the flowers; leaves ovate-oblong, acuminate, with undulated margins, and are, as well as the branchlets, glabrous; fruit ovate. ț. S. Native of Guiana, on the banks of the river Sinnenari. Myrtus undulata, Spreng. syst. 2. p. 482. Leaves 6-7 inches long, full of pellucid dots. Peduncles very short, branched. The flowers are said to be 5-cleft, by Aublet, but in the figure they are drawn 4-cleft. Berry red, 1-seeded.

Waved-leaved Eugenia. Shrub 3 to 4 feet.

56 E. t. anastomosans (D. C. l. c.) pedicels 1-flowered, axillary and lateral, 2-3 together, 3 times longer than the petioles, bibracteolate under the flowers; leaves oval, acute, membranous, glabrous; lateral nerves running into a vein, which is distant from the margin; calycine lobes very obtuse, 2 smaller than the rest. ț. S. Native of French Guiana. Ovarium subglobose-ovate, 2-celled, few-seeded. Style filiform, long. Leaves 4-5 inches long, and 2 inches broad. Pedicels 6-7 lines long. Fruit and seeds unknown.

Anastomosing-reined Eugenia. Tree 10 to 15 feet.

57 E. microstomata (D. C. l. c.) pedicels axillary, 3-9 to-
Myrtaceae. XXXIII. Eugenia.

gather, 1-flowered, length of the petioles, umbellate, refracted after flowering; fruit globose, depressed; ovary 4-lobed, ovate; leaves ovate, acuminate, petiolate, and are as well as the branches, glabrous; lateral nerves running into a vein which is distant from the margin. ♂ S. Native of Brazil, at the river Amazon. Myrtus umbellata, Mart. herb. but not of Spreng. Leaves 5 inches long and 2 broad, full of minute pellucid dots. Petioles 3 inches long. Pedicels 4 lines long. Seeds 1 to 3. Fruit orange-coloured.

Small-pored-leaved Eugenia. Tree.

58 E. \\

59 E. Hilariæna (D. C. I. c.) pedicels axillary, 2-5-together, 1-flowered, longer than the petioles, bluntly bibracteolate under the flowers; fruit globose, crowned by the calycine lobes, which are 4, obtuse, and conniving; leaves linear-oblong, obtuse, attenuated at the base, stiff, opaque, on very short petioles, and are as well as the branches glabrous, with revolute edges. ♂ S. Native of Brazil, in the province of the Mines. Leaves 2 to 3 inches long, and half an inch broad. Petioles 1 inch long. Pedicels 4 lines long. Fruit smaller than a pea.

St. Hilare's Eugenia. Shrub 4 to 5 feet.

60 E. fruticulosa (D. C. prod. 3. p. 270.) pedicels axillary, 1-flowered, longer than the petioles, lower ones solitary, upper ones 2-3 together, minutely bibracteolate under the flower; fruit ovate; calycine lobes obtuse; leaves oblong, cuneate at the base, obtuse at the apex, stiff, opaque, glabrous in the adult state, as well as on the branches, but when young clothed with adpressed down beneath. ♂ S. Native of Brazil, in the province of St. Paul. Myrtus fruticulosa, Mart. herb. A small shrub, having the branches knotted at the base. Leaves nearly 2 inches long, and 4-5 lines broad. Pedicels 4 lines long. Fruit yellow. Seed one, large.

Rugby Eugenia. Shrub 1 to 2 feet.

61 E. kusciolra (Poir. suppl. 3. p. 123.) pedicels axillary, solitary or the upper ones are aggregate, glabrous, longer than the petioles; leaves ovate, obtuse, coriaceous, glabrous, dotted beneath. ♂ S. Native of South America. Myrtus daphnoides, Spreng. syst. 2. p. 450. Fruit and seeds unknown. Perhaps the peduncles are one or many-flowered.

Butcher's-broom-leaved Eugenia. Shrub.

62 E. ? oleiflora (D. C. prod. 3. p. 270.) pedicels 1-flowered, axillary, 4 in a fascicle, twice the length of the petioles, bibracteolate under the flowers; leaves oblong, obtuse, cuneate at the base, coriaceous, shining, and are, as well as the branches, glabrous; calyx 4-cleft. ♂ S. Native of South America, in the province of Jaen de Braamoros, at the river Maranon. Myrtus oleiflora, H. B. et Kunth, nov. gen. amer. 6. p. 147. Pedicels 3 lines long. Berry 3-celled; cells 8-ovulate. Seeds unknown. Allied to Eugenia buzziflora.

Olive-leaved Eugenia. Shrub 4 to 6 feet.

63 E. pistacifolia (D. C. I. c.) pedicels 3-together, axillary, 1-flowered, twice the length of the petioles, minutely bibracteate at the base, and bibracteolate at the apex; tube of calyx glabrous; leaves ovate-lanceolate, obtuse at the base, blunt at the apex, rather coriaceous, and are, as well as the branches, glabrous. ♂ S. Native of Brazil, in the provinces of Bahia. Myrtus pistacifolia, Mart. herb. Leaves with a few pellucid dots, like those of the Pistacia. Pedicels 5-4 lines long, rising from very short sealy branches. Flowers small. Fruit unknown.

Pistacia-leaved Eugenia. Tree 10 to 12 feet.

64 E. stictophylla (Mart. herb. ex D. C. prod. 3. p. 270.) glabrous; pedicels 5-7, aggregate, 1-flowered, rising from the axis of the old leaves, sometimes upon a very short peduncle; bracteas 2, ovate, adpressed to the ovarium; lobes of calyx 4, ovate, nearly orbicular, full of glandular dots; leaves nearly sessile, ovate or oval, obtuse at both ends, coriaceous, opaque, reticulately nerved on both surfaces. ♂ S. Native of Brazil, in the interior provinces. Pedicels 5-6 lines long. Leaves 3 inches long and 1½ broad.

Dotted-petalled Eugenia. Shrub 4 to 6 feet.

65 E. erythrocarpæa (D. C. prod. 3. p. 270.) pedicels 1-flowered, axillary, usually 5-together, racemously umbellate, one-half shorter than the leaves, furnished with one bractea at the base, 2 bracteoles under the flowers; leaves elliptic, obtuse, acute at the base, coriaceous, shining, and are, as well as the branches, glabrous; calyces 4-cleft. ♂ S. Native of New Granada, near Honda. Myrtus erythrocarpæa, H. B. et Kunth, nov. gen. amer. 6. p. 148. Leaves 12-14 lines long. Ovarium glabose, 2-celled; cells 10-11-ovulate. Berry red. Seeds unknown.

Red-fruited Eugenia. Tree 6 to 8 feet.

Maximilian's Eugenia. Shrub 3 to 4 feet.

67 E. ? Lambertiana (D. C. I. c.) pedicels 1-flowered, 5-6-together, axillary, much shorter than the leaves, minutely bibracteate under the flowers; leaves ovate, acutish at both ends, with a very few dots, reticulately veined beneath, rather coriaceous, and are, as well as the branches, quite glabrous; calycine lobes ovate, obtuse. ♂ S. Native of the West Indies, in St. Vincent's. Petioles 3 lines long, hardly shorter than the pedicels. Leaves 4 inches long and 1½ inches broad. Fruit ovate-globose, 1-seeded.

Lambert's Eugenia. Shrub.

68 E. fluviolífera (D. C. I. c.) glabrous; pedicels 1-flowered, hardly longer than the petioles, 5-7 from the axis of the old leaves, each bearing 2 ovate bractees at the apex, which are adpressed to the ovarium; calycine lobes 4 ovate; leaves ovate, coriaceous, obtuse, opaque, shining above, tubercularly dotted beneath. ♂ S. Native of Brazil, in the provinces of the Mines. Branches terete, robust. Leaves ½ inch long. Petioles 2 lines long. Flowers small. Fruit unknown.

Many-flowered Eugenia. Shrub.

69 E. bahiensis (D. C. prod. 3. p. 271.) pedicels 2-7-together, or arising from a short rachis, 1-flowered, a little longer than the leaves, minutely bibracteate at the apex; leaves elliptic, somewhat acuminate, opaque, and are, as well as the branches, glabrous; lateral veins hardly prominent; calycine lobes 4, roundish. ♂ S. Native of Brazil, in the province of Bahia, in dense woods. Myrtus Lambertiana, Mart. herb. Very nearly allied to E. Lambertiana, but the leaves are a little narrower, more brown, never reticulated. Flowers double the size. Fruit unknown.

Bahia Eugenia. Tree 10 to 12 feet.

70 E. ? Parkeriana (D. C. prod. 3. p. 271.) pedicels 1-flow-
E. Native to Demerara and of the Island of Trinidad. Sieb. pl. tram. no. 245. Allied to E. Patrissii and E. interposula, but differs in the pedicels being in fascicles, 6-7 lines long. Leaves 2 inches long, full of pellicid dots. Fruit and seeds unknown.

Parker's Eugenia. Subrub.

71. E. corinosa (Vahl. incl. in herb. Puerari ex D. C. l. c.) pedicels 1-flowered, aggregate in the axils of the upper leaves, and much shorter than 1 cm, bearing 2 ovate bracteae under the flowers; leaves oval, bluish at both ends, coriaceous, and are, as well as the branches, quite glabrous; calycine lobes 4, roundish. E. S. Native of Guinea. Leaves 1½ inch long, and 8-10 lines broad. Pedicels 3-4 lines long. Flowers smaller than those of Myrtus communis. Ovarium globose. Fruit and seeds unknown.

Crowned-fruited Eugenia. Shrub.

72. E. adenocalyx (D. C. prod. 3. p. 271.) pedicels 3-5-together, 1-flowered, in fascicles, shorter than the petioles, glabrous; leaves broad, ovate, acuminate, coriaceous, full of pellicid dots; branches and flowers quite glabrous; calyx 4-cleft, obtuse, full of glandular dots; bracteoles 2 at the base of the calyx, very blunt, and somewhat connate. E. S. Native of Cayenne. Leaves 4 inches long, 2½ broad; lower ones on the branches obtuse. Pedicels hardly ½ line long. Fruit and seeds unknown.

Gland-calycy Eugenia. Shrub.

73. E. bimarginata (D. C. l. c.) pedicels 5-7-together, axillary, 1-flowered, much shorter than the leaves, bracteolate under the flowers; calyx with an obovate tube, and bluish short lobes; leaves ovate or ovate-oblong, sessile, somewhat cordate at the base, obtuse at the apex, coriaceous, stiff, opaque; marginal nerve double, outer one contiguous to the margin. E. S. Native of Brazil. Myrtus antidesmenscito, Mart. herb. Leaves of the lower branches 15 lines long, and 11-12 lines broad; upper ones 20 lines long and 9 lines broad, with the margins of all reflexed. Pedicels 2 lines long.

Double-margined-leaved Eugenia. Shrub 4 to 8 feet.

74. E. vittula (D. C. prod. 3. p. 271.) pedicels 1-3-together, axillary, a little shorter than the leaves, glabrous, bracteolate at the apex; calyx with a roundish tube and subcoriaceous lobes; leaves sessile, ovate, cordate at the base, obtuse at the apex, coriaceous, opaque, glabrous above, clothed with hoary velvety down beneath, as well as on the branchlets, but at length becoming naked. E. S. Native of Brazil, in the provinces of the Mines. Myrtus vittula, Mart. herb. Leaves 10-12 lines long and 1-9 broad. Pedicels 5-6 lines long. Calyx glabrous. Stamens shorter than the petals.

Old Eugenia. Shrub 4 to 6 feet.

75. E. maritima (D. C. l. c.) pedicels 2-3-together, 1-flowered, hardly longer than the petioles, bracteolate at the apex, rising from a very short rachis, in something like racemes; calyx with an obovate tube, and ovate-roundish lobes; leaves oval, bluish, glabrous, opaque; lateral veins hardly evident at the apex. E. S. Native of Brazil, by the sea-side at Ilheus. Myrtus maritima, Mart. herb. Leaves 1½ inch long, and 9-10 lines broad. Pedicels 2-3 lines long. Flowers small.

Sea-side Eugenia. Shrub.

76. E. Roxb. hort. beng. (D. C. l. c.) pedicels 1-flowered, axillary and lateral, aggregate or subracemose, much shorter than the leaves, bracteolate under the flowers; leaves oval, bluish, coriaceous, dotless, glabrous; calyx and pedicels clothed with rusty pubescence. E. S. Native of the East Indies, in Silhet. Eugenia Zeylanica, Roxb. hort. beng. p. 92. but not of Wild.

Fruit globose, 1-seeded, glabrous, about the size of a grain of pepper. Leaves 15 lines long, and 7-8 lines broad.

Roxburgh's Eugenia. Tree.

77 E. minima (Blum. cat. hort. built. p. 75.) pedicels crowded, axillary, 1-flowered, shorter than the leaves; calyx crenulate; leaves on short petioles, elliptic-lanceolate, glabrous, full of fine parallel stripes. E. S. Native of Java, in woods. Myrtus variegata, Blum. hýdr. p. 1082. Fruit small, obovate, 1-seeded. Seeds of Eugenia. Calyx somewhat attenuated at the base.

Small Eugenia. Shrub 4 to 6 feet.

78 E. tenella (D. C. prod. 3. p. 272.) pedicels 1-3, very short, axillary, 1-flowered, minutely bracteolate under the flowers; lobes of calyx 4, obtuse; leaves oval, obtuse, somewhat acuminate at the base, membranous, full of pellicid dots, veinless, except the middle nerve, glabrous; petioles and branchlets puberulous. E. S. Native of Brazil, on high mountains in the provinces of the Mines. Myrtus tenella, Mart. herb. Habit almost of E. alpina and E. obtusa, but truly different. Stamens and style exerted. Fruit unknown. Leaves 6-7 lines long, and 3 lines broad. Flowers small. Perhaps referrible to section iii.

Weak Eugenia. Shrub 2 to 3 feet.

79 E. flavescens (D. C. prod. 3. p. 272.) pedicels 3-5-together, axillary, 1-flowered, bracteolate at the apex; lobes of calyx 4, ovate, acutish; leaves ovate, acuminate at the base, and attenuated at the apex, obtuse, membranous, full of pellicid dots, glabrous on both surfaces, as well as on the petioles, pedicels, and calyxes. E. S. Native of Brazil, in the desert of Bahia. Myr'tus flava, Mart. herb. Calyxes yellowish. Petals 4, orbicular, white, ex Mart. Staminiferous disk 4-sided in the middle of the flower. Style longer than the filaments. Fruit unknown.

Yellowish Eugenia. Shrub 4 to 6 feet.

*** Flowers axillary, almost sessile, or on short peduncles, and disposed in glomerate fascicles in the axils of the leaves.

80 E. L'hertieriana (D. C. prod. 3. p. 272.) flowers axillary, sessile, crowded; leaves elliptic-acuminated, and are, as well as the branches, quite glabrous; lateral nerves confluent near the margins. E. S. Native of Tobago. Myr'tus dumosa, L'Herit. herb. but not of Vahl. Very nearly allied to E. coffee-folia. Leaves less opaque, full of pellicid dots when examined by a lens.

L'Heritier's Eugenia. Shrub 5 to 6 feet.

81 E. coffeafolia (D. C. l. c.) flowers axillary, sessile, crowded; leaves elliptic-acuminated, and are, as well as the branches, quite glabrous; lateral nerves of leaves confluent at the apex, a considerable distance from the margin of the leaf. E. S. Native of Cayenne. Fruit globose, glabrous, size of a small pea. Seed one, roundish. Embryo homogeneus. Leaves obscure, almost without dots, 4-6 inches long, and from 1-2 inches broad.

Coffee-leaved Eugenia. Shrub 6 to 8 feet.

82 E. affinis (D. C. l. c.) peduncles axillary, branched, 3-flowered, very short, bracteolate at the base; leaves ovate-oblong, acuminate, at the apex, and are, as well as the branches, quite glabrous; lateral nerves of leaves confluent at the apex, a considerable distance from the margin of the leaf. E. S. Native of Cayenne. Fruit globose, glabrous, size of a small pea. Seed one, roundish. Embryo homogeneous. Leaves obscure, almost without dots, 4-6 inches long, and from 1-2 inches broad.

Coffee-leaved Eugenia. Shrub 6 to 8 feet.

83 E. calophylloides (D. C. l. c.) flowers axillary and lateral, crowded, nearly sessile, 4-cleft; leaves oval, acute, shining above, glabrous in the adult state; nerves on the under surface, petioles, branchlets, pedicels, and calyceal tube, clothed with rusty velvety down. E. S. Native of Sierra Leone. 5 R
Calophyllodes lucida, Smeehan. mas. Lobes of calyx ovate, obtuse, smoothish, leaves 5-6 inches long, and 2 or 2½ broad, on very short petioles, dotted; lateral nerves convergent towards the margins. Ovarium globose. Fruit and seeds unknown.

Calophyllum-like Eugenia. Shrub 10 feet.

84. E. crusiophyllum (Poir. suppl. 3. p. 129.) flowers axillary, almost sessile, aggregate, 4-cleft; leaves ovate, acute, glabrous and shining above, but clothed with adpressed silky golden down beneath, which becomes nearly deciduous; fruit ovate, rather velvety. h. s. Native of Cayenne, not in the Mauritius. Myrtus crusiophyllum, Spreng. syst. 2. p. 482. exclusive of the synonyms. Flowers clothed with rusty down, sessile. Pedicels 2 lines long after flowering, rather branched at the base. Mature fruit size of an olive, 1-seeded. Cotyledons conferruminated, furnished with bladdery glands inside.

Golden-seeded Eugenia. Tree.

85. E. cortata (D. C. l.) flowers almost sessile, axillary, lateral, rather crowded; leaves sessile, ovate, very blunt, rather cordate, shining, and are, as well as the branches, quite glabrous; calyxes 4-5-cleft. h. s. Native of the West India Islands. Myrtus cortata, Swartz, fl. ind. occ. p. 853. Vahl. symb. 2. p. 55. Branches compressed above. Ovarium roundish. Stigma deflexed. Fruit and seeds unknown.

Cordate-leaved Eugenia. Shrub 2 to 3 feet.

86. E. lateriflora (Wildc. spec. 2. p. 749.) flowers almost sessile, lateral, crowded or scattered; leaves obovate-roundish, very blunt, attented at the base, with revolute margins, coriaceous, pale beneath, reticulated from elevated veins on both surfaces, and are, as well as the branches, quite glabrous. h. s. Native of the Island of Santa Cruz. E. sessiliflora, Vahl. symb. 3. p. 64. Calyx and petals dotted. Fruit and seeds unknown.

Side-flowered Eugenia. Tree.

87. E. sessiliflora (D. C. prod. 3. p. 273.) flowers almost sessile, lateral, crowded or scattered; leaves oblance or oval, bluntish, with somewhat revolute margins, rather membranous, hardly veined, and are, as well as the branches, quite glabrous. h. s. Native of St. Domingo. Myrtus sessiliflora, Spreng. syst. 2. p. 479. E. sessiliflora, Vahl. symb. 3. p. 64. ? E. lateriflora, Pers.? Fruit one-half smaller than those of E. lateriflora, but not sufficiently known.

Sessile-flowered Eugenia. Shrub.

88. E. linearata (D. C. prod. 3. p. 273.) flowers axillary, almost sessile, crowded; leaves ovate, acuminate, stiff, lined with elevated nerves, hoary beneath, but villous on the nerves; calyxes 4-cleft, clothed with rusty down. h. s. Native of St. Domingo, in mountain fields. Myrtus linearata, Swartz, fl. ind. occ. p. 891. but not of Blume. Berry sapid scarlet, size of a cherry. Seeds 2 or more, angular. Leaves full of pellucid dots, but they are said to be scentless.

Lined-leaved Eugenia. Shrub 6 to 10 feet.

89. E. ? tuberculata (D. C. l.) flowers crowded in the axils of the leaves, and on the tops of the branches, sessile, bibracteolate at the base, 4-cleft; leaves elliptic-oblong, coriaceous, with revolute edges, clothed with glanular tubercles above, and glabrous, but with silky down beneath, as well as on the calyxes; branchlets hairy. h. s. Native of Cuba, near Regla. Myrtus tuberculata, H. B. et Kunth, nov. gen. amer. 6. p. 143. Ovarium 2-celled; cells 8-10-ovulate. Fruit and seeds unknown. Said to be allied to E. lineata.

Tubercular-leaved Eugenia. Shrub.

90. E. cauliflora (D. C. l.) flowers crowded, rising from the excoriated trunk and branches, from where the axes of the old leaves had been; pedicels very short, 1-flowered; leaves lanceolate, petiolate, attenuated at the base, long-acuminated at the apex, with a very few pellucid dots, and are, as well as the branches, glabrous. h. s. Native of Brazil. Myrtus cauliflora, Mart. rose, p. 285. isis. 1824. p. 589. but not of Blume. Berry edible, globular of a purplish-violet colour, 1-seeded. Cotyledons conferruminated. Leaves 3 inches long and 9-10 lines broad. Petioles 2 lines long.

Stem-flowered Eugenia. Tree 10 to 20 feet.

91. E. umbellata (D. C. l.) pedicels numerous, short, 1-flowered, bibracteolate at the apex, rising from the axils of the old branches; leaves sessile, cordate at the base, ovate, acutish, coriaceous, opaque, and are, as well as the branchlets, glabrous, with the marginal nerve thick. h. s. Native of Brazil, in woods at Vao do Paranan. Myrtus lateriflora, Mart. herb. but not of others. Umbels lateral, 7-8-flowered. Pedicels 2-3 lines long. Calyce lobes 4, roundish. Leaves 2-4 inches long and 1-2 broad. Lateral nerves of leaves confulent in front of the margins.

Umbellate-flowered Eugenia. Shrub 6 to 8 feet.

92. E. delicatula (D. C. l.) flowers 2-3-together, axillary, nearly sessile; leaves oblong, attenuated at both ends, stiffish, ovate, dotted beneath, glabrous on both surfaces, with a marginal nerve; pedioles very short, and are, as well as the young branches, clothed with down. h. s. Native of Brazil, in the province of St. Paul. Myrtus delicatula, Mart. herb. A tree about 20 feet high, much divided. Leaves 15 lines long and 3 lines broad. Flowers small, like those of E. rigidia.

Delicate Eugenia. Tree 20 feet.

93. E. rigida (D. C. l.) flowers axillary, 1-3-together, nearly sessile, aggregate, bracteolate; fruit glabrous, somewhat depressed; calyce lobes 4, short, obtuse, somewhat conic-ovoid after flowering; leaves ovate, acute, stiffish, glabrous, except the middle nerve, glabrous; petioles and branchlets pubescent. h. s. Native of Brazil, in the provinces of the Mines. Myrtus rigida, Mart. herb. Leaves 9-10 lines long and 4-5 broad. Pedicels very short, pubescent. Bracteoles obtuse. A much branched small tree. Flowers small. Fruit size of a pea, 2-seeded. Cotyledons conferruminated.

Stiff Eugenia. Tree 15 feet.

Guapurea Eugenia. Shrub or tree.

95. E. cerasiformis (D. C. prod. 3. p. 274.) corymbs axillary or terminal, simple; branchlets 3-flowered; calyx 4-cleft; ovary hemispherical; leaves broad-lanceolate, bluntly acuminate, coriaceous, glabrous, with recurved margins, full of fine transverse parallel veins. h. s. Native of Java, on the mountains at fountains of rivers. Allied to E. lineata, but the rib of the leaf is for the most part purplish, and the marginal vein is simple. Myrtus cerasiformis, Blum. bijdr. p. 1088. Fruit globose. Seeds thick, angular, about 3 in number. Cotyledons conferruminated. Flowers not seen.

Cherry-formed-fruited Eugenia. Shrub.

96. E. ? triflora (Ham. prod. fl. ind. occ. p. 44.) peduncles axillary, usually tern, 3-flowered; flowers bracteolate, sessile; leaves alternate, petiolar, oblong, attenuated at the base, shining, greyish green beneath. h. s. Native of Carthagena, in woods. Myrtus triflora, Jacq. stirp. am. p. 153. t. 199. f. 59. but not of Spreng. Petals 4, obovate. Fruit unknown. Leaves aromatic when bruised. This species differs from all in the leaves being alternate, but perhaps this is the case only at the tops of the branches.
Three-flowered Eugenia. Shrub or tree.

97. E. brachiata (D. C. l. c.) peduncles a little branched, axillary, shorter than the petals, minutely bibracteolate under the flowers; leaves elliptic, acuminate at the apex, shining above, pale beneath, glabrous on both surfaces; calyxes glabrous; bractelets and pedicels clothed with rufous velvety down. f. S. Native of Cayenne. Leaves 2 or 3 inches long and an inch broad, full of pellucid dots. Pedicels 3 inches long. Fruit while young globose and 1-seeded.

Short-pedicelled Eugenia. Shrub or tree.

98. E. disticha (D. C. l. c.) peduncles axillary, branched, 3-5-flowered, very short; leaves distich, ovate-lanceolate, acute, glabrous; lateral nerves confluent within the margin; calyx 4-lobed; stigma hooked. f. S. Native of Jamaica, on the mountains. Myrtus disticha, Swartz, fl. ind. occ. p. 894. Sims, bot. mag. t. 807. Lindl. coll. t. 19. good. Myrtus horizontalis, Vent. malm. t. 60. In Swartz's plant the leaves are said to be very coriaceous, and with the lateral veins hardly manifest, but it is probably the same. Fruit ovate, red. Seeds 2-4, thick. Cotyledons confluent.

Distich-leaved Eugenia. Clt.? Shrub 5 to 6 feet.

99. E. glabrata (D. C. l. c.) peduncles axillary, many-flowered, very short; leaves elliptic, acuminate, convex, coriaceous; branches and flowers quite glabrous. f. S. Native of St. Domingo, in bushy places, on the mountains. Myrtus glabrata, Swartz, fl. ind. occ. p. 903. but not of Blume. Peduncles and petioles 1 inch long. Leaves an inch and a half or 2 inches long, and an inch broad. Berry oblong, black. Seeds 1-2, oblong.

Smooth Eugenia. Shrub 4 to 6 feet.

100. E. campesi (D. C. l. c.) flowers axillary, crowded, nearly sessile; leaves oval-oblong, acuminate at both ends, opaque, rather villous above when young, but at length becoming glabrous, rather hairy beneath and pale; branches compressed, rather hairy; branches white, glabrous. f. S. Native of Brazil, in fields, in the province of Minas Geraes. Myrtus campesi, Mart. herb. Pedicels hardly any. Bracteoles 2 and are, as well as the calyxes, hairy. Lobes of calyx oblong, bluntish. Petals roundish, emarginate. Style exserted. Leaves 2 inches long and 9 lines broad. Petioles 2 lines long. Fruit unknown.

Field Eugenia. Tree 20 feet.

101. E. axillaris (Poir. suppl. 3. p. 126.) peduncles axillary, many-flowered, very short, at length rather longer than the petals; pedicels minutely bibracteolate under the flowers; leaves ovate, bluntish, acuminate, flat, shining; branches and flowers glabrous. f. S. Native of Jamaica, on the mountains. Myrtus axillaris, Swartz, fl. ind. occ. p. 901. but not of Poir. Leaves 2-8 inches long, on very short petioles. Flowers minute, white. Stamens very short. Berry ovate, 1-seeded. Allied to E. monticola and E. glabrata.

Bramble-flowered Eugenia. Shrub 4 to 6 feet.

104. E. melicarpa (Willd. spec. 2. p. 960.) peduncles axillary, branched, many-flowered, very short; pedicels bibracteolate under the flowers; leaves obovate-oblong, obtuse, attenuated at the base, opaque, dotted beneath, with somewhat revolute edges, and are, as well as the branches and flowers, glabrous. f. S. Native of St. Domingo, in sterile places. Myrtus buckifolia, Swartz, fl. ind. occ. 2. p. 899. E. myriotodes, Poir. suppl. 3. p. 125. Style curved. Fruit roundish, 1-seeded. Embryo of E. disticha. Leaves 1 or 1 1/2 inch long, of an obscure brown-colour.

Boz-leaved Eugenia. Fl. May, Ju. Clt. 1818. Sh. 4 to 6 feet.

105. E. monticola (D. C. prod. 3. p. 275.) racemes many-flowered, very short, axillary, solitary; leaves ovate or oval, obtuse, flat, opaque, and are, as well as the branches, glabrous; calyx 4-5-lobed. f. S. Native of Jamaica, on the high mountains. Myrtus monticola, Swartz, fl. ind. occ. 2. p. 898. Racemes few-flowered. Flowers 4-cleft. Leaves ovate-oblong. The fruit is unknown, but the plant is so nearly allied to Eugenia buckifolia as hardly to be distinguished from it.

Mountain-born Eugenia. Shrub 4 to 6 feet.

106. E.? Guadalupensis (Jacq. coll. 3. p. 183. icon. rar. t. 486.) racemes axillary, hardly equal in length to the petals, and are, as well as the calyces, pubescent; pedicels bibracteolate under the flowers; leaves ovate, coriaceous, opaque, obtuse or emarginate at the apex, and are, as well as the branches, glabrous; calyx 4-5-lobed. f. S. Native of Guadalupe. Eug. buckifolia, Spreng, in herb. Balb. EUG. BUCIFOLIA var. Guadalupensis, Spreng. syst. 2. p. 483. Leaves 2 inches long, 12-15 lines broad. Petioles 3 lines long, rather longer than the racemes. Fruit and seeds unknown.

Guadalupensis Eugenia. Shrub 6 to 8 feet.

107. E. Baraensis (Jacq. coll. 3. p. 183. icon. rar. t. 486.) racemes axillary, hardly equal in length to the petals, and are, as well as the calyces, pubescent; pedicels bibracteolate under the flowers; leaves ovate or oblong-lanceolate, blunt, acuminate at the apex, membranous, full of pellucid dots. f. S. Native of the Island of Baru, and of St. Domingo. Myrtus Baraensis, Spreng. syst. 2. p. 483. Leaves 3 inches long and an inch broad. Petioles 4-5 lines long. Stamens a little longer than the petals. Fruit globose, glabrous, 1-seeded.

Par. f. latifolia (D. C. l. c.) racemes and calyces glabrous; leaves ovate-lanceolate. f. S. Native of St. Domingo. Eug. latifolia, Spreng. in herb. Balb. but not of Aubl. Perhaps a proper species.

Bara Eugenia. Clt.? Shrub 4 to 6 feet.

108. E.? caseroides (D. C. l. c.) racemes axillary and nearly terminal, twin, short, in conglomerate whors; pedicels bibracteolate at the base of the calyces; leaves oblong, acuminate, acute at the base, membranous, glabrous, puberulous on the nerve beneath, as well as the branches and peduncles. f. S. Native of Cumana, on Mount Cocalic. Myrtus caseroides, H. B. et Kunth, nov. gen. amer. 6. p. 145. t. 566. Leaves an inch and a half long, full of pellucid dots. Ovarium 2-celled; cells 6-ovulate. Fruit and seeds unknown. There is a plant very nearly allied to this, which was collected in St. Domingo under the name of Myrtus præcera, Browne, but not of Swartz.

Caseroides-like Eugenia. Shrub 4 to 6 feet.

109. E.? Malpighioides (D. C. l. c.) racemes axillary and nearly terminal, twin, very short, 4-8-flowered; pedicels bibracteolate under the flowers; leaves ovate, acuminate, coriaceous, glabrous, shining; branches hairy. f. S. Native of South America; in the province of Juan de Bracamoros, at the river 5 8 2.

Malpighioid-like Eugenia. Shrub 6 to 8 ft.

110 E. Guayaquilensis (D. C. I. c) racemes axillary, short, about equal in length to the petioles, in congested whorls; leaves oblong, acuminate, narrowed at the base, rather coriaceous, covered with adpressed hairs on both surfaces; branches hairy.  S. Native of Quito, near Guayaquil. Myrthus Guayaquilensis, H. B. et Kunth, nov. gen. amer. 6. p. 147. Leaves 3-4 inches long, and an inch and a half broad. Fruit glabrous, 1-seeded, hardly the size of a sloe. Seeds unknown.

Guayaquil Eugenia. Shrub 3 to 4 feet.

111 E. Sinemariensis (Aubl. guian. 1. p. 501, t. 198) peduncles axillary, very short, branched, 3-6-flowered; pedicles bracteolate under the flowers; leaves ovate-oblong, acuminate, full of pedicellulot, dots, and are, as well as the branchlets, glabrous.  S. Native of Guiana, on the banks of the river Sinemari. Myrthus Sinemariensis, Spreng. Leaves rather membranous, 5-6 inches long, and from 1 to 2 broad. Fruit globose, 1-seeded. Cortyledons confruminated. Seeds somewhat globose. Flowers sometimes 5-cleft, and the seeds are sometimes 2-3.

Sinemari Eugenia. Fl. May, July. Clt. 1823. Sh. 2 to 3 ft.

112 E. chrysocephalides (D. C. prod. 3. p. 276.) racemose axillary, very short, branched, and are, as well as the calyxes, clothed with rufus silky down; pedicels longer than the racis; leaves elliptic, acuminate, coriaceous, glabrous above, but clothed with rufous silky deciduous down beneath, when young and rather velvety; style flexuous, elongated.  S. Native of Cayenne. Allied to Eug. chrysocephalum, but the flowers are evidently pedicellate, and disposed in short racemes. Lobes of calyx reflexed. Bracteoles none under the flowers. Fruit and seeds unknown.

Chrysocephalum-like Eugenia. Shrub.

113 E. Bracteosa (D. C. I. c) pedicles 1 or 3 together, axillary, 1-flowered, and are, as well as the calyxes, bracteas, branches, and young leaves, clothed with tomentum; bracteoles about equal in length to the calyx; leaves oblong, dotless, coriaceous, glabrous above, and at length naked beneath, obtyne, callously mucronate; branches compressedly terete.  S. Native of Brazil, in the provinces of the Mines. Pedicels 2 lines long. Leaves 2-5 inches long and 6-7 lines broad, opaque. Fruit unknown. This species has the habit of E. alpigena.

Bracteeata Eugenia. Tree.

114 E. Xalapensis (D. C. I. c) peduncles axillary, short, 2-6-flowered; leaves ovate, acuminate, acute at the base, rather membranous, shining, and are, as well as the branches, glabrous.  S. Native of Mexico, near Xalapa. Myrthus Xalapensis, H. B. et Kunth, nov. gen. Amer. 6. p. 145.

Xalapa Eugenia. Shrub 6 feet.

115 E. Dumosa (D. C. I. c) peduncles axillary, very short, 4-flowered, bracteate at the base of the pedicels and under the flowers; leaves petioleate, broad-lanceolate, acuminate, membranous, clothed with silky villi.  S. Native of South America. Myrthus dumosa, Vahl. symb. 2. p. 57.

Bushy Eugenia. Fl. June, July. Clt. 1753. Sh. 3 to 4 ft.

** * ** Peduncles axillary, bifid or dichotomous; the flowers in the forks sessile, the rest pedicellate.

117 E. Sprengelii (D. C. I. c) peduncles axillary, aggregate, 2-flowered, shorter than the leaves, bracteate under the flowers; leaves linear, obtuse, veinless, coriaceous; calyx 4-cleft.  S. Native of Brazil. Angustifolia, Spreng. nov. prov. 18. but not Lam. Petals oblong. Fruit and seeds unknown.

Sprengel's Eugenia. Shrub.

118 E. compressa (D. C. I. c) peduncles axillary, shorter than the leaves, 3-flowered; flowers 4-cleft, middle one sessile, lateral ones pedicellate; leaves oblong, obtuse, running into the petiole at the base, rather coriaceous, reticulated, and are, as well as the compressed branches, glabrous.  S. Native of Peru, near Cajamarca. Myrthus compressa, H. B. et Kunth, nov. gen. amer. 6. p. 135. Ovarium 2-celled; cells 14-15-ovulate. Fruit and seeds unknown.

Compressed-branch Eugenia. Shrub.

119 E. Apiculata (D. C. I. c) peduncles axillary, a little longer than the leaves, bifid, 3-flowered, middle flower sessile, lateral ones pedicellate; pedicels minutely bracteolate under the flowers; leaves, oblong, glabrous, and very narrow, in a whorls.  S. Native of Peru. Myrthus lanceolata, Juss. herb. Jaun. in Duhan. ed. nov. 1. p. 208. but not E. lanceolata, Lam. Allied to E. discolor, but the leaves are much narrower, 10-12 lines long and 3 lines broad. Pedicels 5 lines long, sometimes 1-flowered at the apex, sometimes 3-flowered; pedicels, especially 2, rising from the axils of the bracteas, 4 lines long, 1-flowered. Terus square. Fruit unknown.

Dombey's Eugenia. Shrub or tree.

120 E. Aeuca (D. C. prod. 3. p. 277.) peduncles axillary and nearly terminal, 1-3-flowered, very short, crowded; bracteoles 2, ovate, depressed; tube of calyx pubescent; lobes 4, ovate, ampel, and are as well as the petals full of pedicellulot; style very long, compressed; fruit ovate, many-seeded, crowded; leaves oval, obtuse, or acutish, opaque, glabrous above, but velvety from deciduous tomament beneath, especially when young.  S. Native of Peru. Myrthus Aeuca, Juss. herb. Branches terete, short. Leaves crowded, copper-coloured above, rusty beneath, 15-16 lines long, 6-7 lines broad. Lobes of calyx obtuse, somewhat bifid in the adult state. Stamens elongated. Style twisted when young, at length long and compressed.

Aeuca Eugenia. Shrub.

122 E. Discolor (D. C. I. c) peduncles axillary, shorter than the leaves, usually 3-flowered; flowers quadrifid, middle one sessile, lateral ones pedicellate; pedicels under the calyx, linear-subulate; leaves opposite and tern, elliptic-oblong, acute, running into the petiole at the base, rather coriaceous, reticulated, discolored, shining above, and are as well as the branchlets glabrous; branches triangular.  S. Native on the Andes, near San Felipe. Myrthus discolor, H. B. et Kunth, nov. gen. Amer. 6. p. 134. and M. biloba, t. 540. Ovarium 2-celled. Cells 6-10-ovulate. Fruit and seeds unknown.

Discolored-leaved Eugenia. Shrub.

123 E. Foliosa (D. C. I. c) peduncles axillary, 3-flowered, glabrous, about equal in length to the leaves; flowers 4-cleft, middle one sessile, lateral ones pedicellate; leaves approximate,
roundish-elliptic, rounded at the base, coriaceous, glabrous, shining; branches angular.  ﬂ. S. Native of South America. Myrtus foliös, H. B. et Kunth, nov. gen. amer. 6. p. 134. Ovarium 2-celled; cells 7-8-ovulate. Style curved. Leaves 9-11 lines long and 7-9 lines broad. Fruit and seeds unknown.

Leafy Eugenia. Shrub. 124. E. subamplicaulis (D. C. l. c.) peduncles axillary, shorter than the leaves, 3-flowered; flowers 4-cleft, the one on the bifurcation sessile, and the others pedicellate; lobes of calyx ovate, concrete above the ovarium, but at length reflexed along with the petals; leaves ovate-oblanceolate, coriace at the base, sessile, acuminated at the apex, opaque, glabrous on both surfaces, as well as on the branches. ﬂ. S. Native of Brazil, in woods on Mount Formosa on the confines of the provinces of Rio Janeiro and St. Paul. Myrtus subamplicaulis, Mart. herb. Leaves 3 inches long and an inch broad. Peduncles an inch long. The lateral flowers on pedicles 4 lines long. Petals obovate-oblanceolate.

Somewhat-stem-clasping-leafed Eugenia. Shrub. 125. E. crenulata (Wildl. spec. 2. p. 961.) peduncles axillary, solitary, usually 3-flowered, hardly larger than the very short pedicels; leaves oval or roundish, bluntly suberecten at the apex, and as well as the branches glabrous. ﬂ. S. Native of St. Domingo, in mountain thickets. Myrtus crenulata, Swartz, fl. ind. occ. 2. p. 889. Leaves 6-7 lines long and 4 lines broad. Flowers minute. Petals white, oblanceolate. Stamens very minute. Berry roundish, red, 1-seeded. Seeds roundish.

Crenulated-leafed Eugenia. Shrub 8 to 12 feet. 126. E. branchybrähya (D. C. l. c.) peduncles axillary, few-flowered, a little longer than the pedion, trifid; leaves ovate, acuminated, obtuse at the base, almost sessile, shining, opaque; branches and flowers glabrous. ﬂ. S. Native of Cayenne. Fruit glabrous, glabrous. Seeds few, thick, and rather angular. Leaves 2 inches long and 12-15 lines broad. Racemes 4-5 lines long.

Short-racemose Eugenia. Shrub 5 to 6 feet. 127. E. sieberianä (D. C. l. c.) racemes axillary, few-flowered; fruit ovate-oblanceolate; lobes of calyx 4, short, broad, very obtuse, connivint, crowned; leaves oval, shortly and bluntly apiculated, membranous, full of pellucid dots, white beneath from hardly visible down. ﬂ. S. Native of the Island of Trinidad. Sieb. fl. trin. no. 228. Leaves 3 inches long and 18-21 lines broad. Petioles 3-4 lines long. Peduncles rather velvety, hardly longer than the pedioles. Fruit 7-8 lines long. Seeds oblong.

Sieber's Eugenia. Shrub 5 to 6 feet. 128. E. macrospēra (D. C. l. c.) peduncles axillary, few-flowered, length of the pedioles, shortly trifid at the apex; leaves oval, attenuated at the base, on longish pedicels, acuminated at the apex, glabrous above, rather velvety beneath from rufous deciduous down, as well as the branchlets and pedicels; calyze lobes very obtuse. ﬂ. S. Native of Brazil, in the desert of Bahia. Fruit ovate, crowned by the calyx, glabrous, 1-seeded. Seeds similar to those of a Passiflora, 7 lines long and 5 lines broad. Cotyledons confluent, rather narrowed. Petioles 5 lines long. Leaves 5 inches long, hardly 2-lobed.

Long-seeded Eugenia. Shrub 5 to 6 feet. 129. E. myrobalāna (D. C. l. c.) racemes few-flowered, axillary, short; fruit oblong, bluntly attenuated at both ends, crowned by the lobes of the calyx, which are very short and somewhat incurved, 1-seeded; seeds oblong; leaves ovate, acuminated at the apex, opaque, glabrous on both surfaces, as well as on the branchlets. ﬂ. S. Native of Brazil, at Rio Negro. Myrtus myrobalanus, Mart. herb. Leaves 9 inches long, and $3\frac{1}{2}$-inch broad. Petioles 6 lines long. Fruit an inch long and half an inch broad.

Myrobalan Eugenia. Tree 20 feet. 130. E. salicifolia (D. C. prod. 3. p. 278.) peduncles axillary, shorter than the leaves, twice bifid, 7-flowered, 3 of them sessile in the forks, and 4 of them pedicellate; limb of calyx deciduous; leaves lanceolate, rather membranous, acuminated, reticulately, glabrous on both surfaces, as well as on the branchlets. ﬂ. S. Native of New Granada. Myrtus salicifolia, H. B. et Kunth, nov. gen. amer. 6. p. 136. t. 541. M. dunsöö, Spreng. syst. 2. p. 483. exclusive of the synonyme. Ovarium 2-3-celled; cells 11-18-ovulate. Fruit and seeds unknown.

Willow-leaved Eugenia. Shrub 6 to 10 feet. 131. E. limbatā (D. C. prod. 3. p. 278.) peduncles axillary, shorter than the leaves, bifid, or twice bifid; some of the flowers sessile in the forks, and the others pedicellate; bracteoles linear; leaves oblong, acutish, running into the petiole at the base, coriaceous, reticulately, emarginate, shining, glabrous; branches puberulous. ﬂ. S. Native of Peru, near Ayavaca. Myrtus limbatæ, H. B. et Kunth, l. c. Lobes of calyx ciliately fringed. Stamens beyond 200. Ovarium 2-celled; cells 16-ovulate. Flowers and seeds unknown.

Limbatâ Eugenia. Shrub. 132. E. limbatâ (D. C. l. c.) peduncles axillary, exceeding the leaves, 3-flowered or bifid, with 1 flower in the fork, and the branchlets 3-flowered; bracteate lanceolate, rather foliaceous; leaves roundish-elliptic, obtuse at both ends, coriaceous, reticulate, and as well as the branchlets pubescent; petals fringed with villi. ﬂ. S. Native of Peru, near Ayavaca. Myrtus limbatœ, H. B. et Kunth, nov. gen. amer. p. 137. t. 542. Ovariun 2-celled; cells 15-ovulate. Fruit and seeds unknown.

Fringed-petalled Eugenia. Shrub 10 to 12 feet. 133. E. rohopalōides (D. C. l. c.) peduncles axillary, and nearly terminal, dichotomous, shorter than the leaves, rather coriaceous; flowers sessile in the forks, and the others pedicellate; leaves nearly elliptic, obtuse, acutish at the base, coriaceous, margined, obsoletely veined, glabrous, pubescent when young, as well as the branches and coryst. ﬂ. S. Native of South America, near San Felipe. Myrtus Lindleyana, H. B. et Kunth, l. c. p. 138. t. 543. but not of Mart. herb. Ovarium 2-3-celled; cells 12-13-ovulate. Fruit and seeds unknown.

Lindley's Eugenia. Shrub 10 to 12 feet. 134. E. rhopaloides (D. C. l. c.) peduncles axillary, about equal in length to the leaves, usually 6-flowered and dichotomous at the apex; flowers sessile in the forks, the rest pedicellate; leaves obovate, rounded at the apex, cuneated at the base, reticulated, coriaceous, shining, and are as well as the branches glabrous. ﬂ. S. Native of Peru, at Ayavaca. Myrtus rhopaloides, H. B. et Kunth, l. c. p. 137. Ovarium 2-celled; cells 20 ovulate. Fruit and seeds unknown.

Rhopaloid-like Eugenia. Tree. 135. E. exstincta (D. C. l. c.) peduncles axillary or nearly terminal, length of leaves, bifid or dichotomous, cymose; flowers in threes, middle one sessile; tube of calyx ovate, cloathed with rufous silky down; lobes 4, roundish, reflexed; leaves ob-ovate, obtuse, opaque, pale, glabrous above, but rather velvety beneath when young; pedioles and branches clothed with rufous down. ﬂ. S. Native of Peru. Myrtus exstincta, Domb. mss. but not of Mart. Peduncules sometimes rising by threes from the axils. Bracteoles linear, acute, under the flowers. Leaves 15 lines long and 7-8 broad. Fruit unknown.

Dry Eugenia. Tree 20 feet. 136. E. dichotoma (D. C. prod. 3. p. 278.) peduncles axillary, opposite, or nearly terminal, longer than the leaves, bifid or twice bifid; flowers sessile in the forks, the rest pedicellate; leaves elliptic-lanceolate, attenuated at both ends, 1-nerved, full of pellucid dots, glabrous in the adult state, pubescent on both
MYRTACEÆ. XXXIII. EUZENIA.

Surfaces when young, as well as the branchlets and calyxes. ½. S. Native of St. Domingo. Perhaps the same as Myrtus dichotoma of Vahl. non. Poiret. suppl. 4. p. 53, but Poiret says his plant has 5-cleft flowers, but they are 4-cleft in the plant we have in view. Lobes of calyx blunt. Bracteoles oblong, rather foliaceous. Pedicels twice or thrice the length of the flowers in the forks. Petioles pubescent, 2 lines long. Fruit globose, size of a pea, 2-3-celled.

Dickatuous Eugenia. Shrub 6 to 8 feet.

137 E. Che'ken (Hook. in Bees. bot. p. 56.) peduncles axillary, usually 1-flowered, solitary, longer than the leaves, furnished with 1 minute, deciduous, linear bracteas under the flowers; leaves glabrous, very dense, oval, acute at both ends, on very short pedioles, obliquely and parallelly nerved, full of pellucid dots; calyceine segments very blunt. ½. G. Native of Chili, about Valparaiso. Myrtus folio subrotundulo volgo. Cheken, Fouilli. obs. 5. p. 43. t. 32. Fruit round, black. Seeds 2, rather coriaceous. A decotion of the leaves of this plant is said to cure diseases of the eyes. The bark is so astringent as to render a decoction of it of great use in cases of dysentery.

Cheken Eugenia. Shrub 6 to 6 feet.

138 E. triñé'ria (D. C. prod. 3. p. 279.) peduncles trifid, 1-2-flowered, or twice trifid, 3-4-flowered, shorter than the flowers; bracteoles oblong, under the flowers, and as well as the branchlets and calyxes rather hairy; leaves oval-oblong, acuminate at both ends, glabrous above in the adult state, 3-nerved, and clothed with tomentose pubescence beneath; lateral nerves almost marginal. ½. G. Native of New Holland. Myrtus tomentosa. Smith, in Lin. trans. 3. p. 80. but not of Lour. Ovarium 2-3-celled, but only 1-celled in the adult state. Fruit globose, size of a pea. Ovula 8-7. Seeds unknown. The leaves are 3-nerved, and the plant therefore allied to Myrtus tomentosa. It is the only species from New Holland, and on that account may probably be a new genus.

* * * * * Peduncles in racemose cymes or panicles, axillary, or the upper ones are terminal.

139 E. xylophi'olia (D. C. prod. 3. p. 270.) peduncles axillary, shorter than the leaves, racemose; pedicels few, elongated, bracteate at the base; leaves oblong, attenuated at the base, acuminate at the apex, coriaceous, opaque, shining above, and are as well as the branchlets glabrous. ½. S. Native of French Guiana. Leaves 2 inches long and 8 lines broad. Pedicels 4 lines long. Calyceine lobes 4, blunt, bent in after flowering. Fruit globose, glabrous, crowned, 1-seeded. Seeds thick, conforming to the fruit. Cotyledons confrumentum, full of resinous vesicles.

Xylophila-leaved Eugenia. Shrub 6 to 8 feet.

140 E. cuspidi'olia (D. C. l. c.) peduncles axillary, very short, racemose, and are as well as the calyxes clothed with rufous down; pedicels 7-9, in umbellate fascicles; leaves elliptic-oblong, cuspidate, coriaceous, hardly with any pellucid dots, glabrous on both surfaces, dotted, and paler beneath. ½. S. Native of Brazil, on the banks of the river Negro. Myrtus cuspidifolia, Mart. herb. A tree 20 to 40 feet. Flowers at first sight appearing as in section second, in second fascicles. Petioles hardly more than 2 lines long. Calyceine lobes 4, reflexed, oval, obtuse. Allied to E. xylophi'olia. Leaves 3 inches long and 1 inch broad.

Cuspidate-leaved Eugenia. Tree 30 to 40 feet.

141 E. spirifil'se'ma (D. C. l. c.) racemose axillary, 3-7-flowered, much shorter than the leaves; pedicels slender; fruit spherical, 1-seeded; seed globose; leaves oblong, attenuated both at the base and apex, acuminate, full of pellucid dots, shining above, pale beneath and dotted, quite glabrous on both surfaces, as well as the branchlets and flowers. ½. S. Native of Brazil, at the Rio Negro. Myrtus cuspidifolia, Mart. herb. Leaves 3 inches long and half an inch broad. Fruit size of a grain of pepper. Lobes of calyx 4, obtuse, short. Allied to E. cuspidifolia and E. xylophi'olia.

Round-seeded Eugenia. Shrub or tree.

142 E. mode'sta (D. C. l. c.) racemes few-flowered, axillary, 3-times shorter than the leaves; bracteas ovate, obtuse, permanent, under the flowers; fruit spherical; lobes of calyx ovate, somewhat introflexed; leaves oblong, attenuated at both ends, narrowed and usually emarginate at the apex, with a few pellucid dots, quite glabrous on both surfaces, as well as the branches. ½. S. Native of Brazil, at the river Ilheos. Myr' tus modesta, Mart. herb. Leaves 2 inches long and 5 lines broad. Racemes 5-7-flowered, 5 lines long. Pedicels opposite, bracteolate at the base. Fruit the size of a grain of pepper, and is as well as the whole plant glabrous.

Modest Eugenia. Shrub or tree.

Vahl's Eugenia. Shrub.

144 E. rupe'scens (D. C. l. c.) peduncles axillary, oppositely racemose, or in fascicles, and are as well as the calyxes clothed with rufous down; leaves oblong, attenuated at the base, bluntish at the apex, opaque, but at length glabrous. ½. S. Native of Brazil, in fields in the province of St. Paul. Perhaps Myr' tus rupe'scens, Spreng. syst. 2. p. 487. Tube of calyx ovate; lobes 4, erect, oblong. Seeds 2-3, compressed in the immature fruit. Leaves 2 or 2½ inches long, and 9-10 lines broad. Racemes one half shorter than the leaves. Pedicels 4 lines long, sometimes in racemes and sometimes in fascicles in the axils of the leaves.

Refescens Eugenia. Shrub 6 to 8 feet.

145 E. confus'a (D. C. l. c.) peduncles axillary, disposed in simple racemes, length of the pedioles; pedicels 1-flowered, twice or thrice the length of the petiole; leaves elliptic, rather attenuated at the base, long-acuminate at the apex, shining above, with revolute margins, full of pellucid dots, and are as well as the branches and flowers glabrous. ½. S. Native of Guadaloupe. E. floribunda, Spreng. in herb. Balb. An intermediate plant, between the second and fifth sections. Pedicels very short, rising from the rachis, bearing 1 bracte at the base of each, and 2 acute bracteoles at the apex, under the flowers.

Confusae Eugenia. Shrub or tree.

146 E. inund'a'ta (D. C. prod. 3. p. 280.) peduncles axillary, shorter than the leaves, 3-7-flowered, racemose; pedicels elongated, and are as well as the calyxes clothed with white down; bracteoles obuse, under the flowers; leaves ovate or obovate, obtuse, membraneous, opaque, glabrous on both surfaces, as well as branchlets. ½. S. Native of Brazil, in inundated places at Rio Negro. Myr' tus inundata, Mart. herb. Leaves 15-18 lines long and 5-6 broad. Petiole a line long. Lower surface of leaves rather dotted. Petals ovate-oblong. Bracteas small, obtuse, under the pedicels. Calyceine lobes obtuse. Fruit unknown.

Inundata Eugenia. Shrub or tree.

147 E. Lân'cea (Poir. suppl. 3. p. 123.) racemes axillary, puberulous, nearly simple, shorter than the leaves; pedicels rather distant, bracteolate under the leaves; leaves oval-ob-
long, acuminated at both ends, rather opaque, and are as well as the branches glabrous, shining above, veinless, and marked with elevated dots. \( \tau \). Native of the Island of St. Thomas. Perhaps a var. of *E. virguliflora*. Stem whiter.

**Lance-leaved Eugenia.** Shrub 6 to 10 feet.

148. *Eugenia triunfa* (D. C. l. c.) peduncles axillary, solitary, opposite, longer than the leaves, disposed in simple racemes; pedicels opposite, 1-flowered, furnished each with 1 bract at the base and 2 at the apex; flowers 4-lobed; leaves elliptic, acuminated, coriaceous, with a few pellucid dots, shining above, and pale beneath, quite glabrous on both surfaces, as well as the branches and peduncles. \( \tau \). Native of the Island of Trinidad.

*Myrtus dioica*, Sieb. pl. exs. trin. no. 94. Leaves an inch and a half long, and half an inch broad. Peduncles slender, 2-3 inches long. Lobes of calyx obtuse. Fruit globose, 1-seeded, a little smaller than a pea. Seed roundish. Cotyledons coniferminated.

**Trinidad Eugenia.** Shrub or tree.

149. *Eugenia polystachya* (Rich. in act. soc. hist. nat. par. 1792. p. 110.) peduncles axillary, solitary, or in fascicles, length of leaves, oppositely racemose, compressed, clothed with rufous velvety down; calyx ovate, bluntly 4-lobed; leaves ovate-lanceolate, acuminated, opaque, coriaceous, glabrous; branchlets compressed, smoothish. \( \tau \). Native of French Guiana.

*Eugenia*, Ruiz et Pav. in herb. Deless. The fruit of the Guiana plant is unknown, but that of Pavon is furrowed from numerous irregular crests, as in *E. uniflora*. Seeds pseudo-cotyledonous.

**Many-spiked Eugenia.** Shrub or tree.

150. *Eugenia margina* (D. C. l. c.) racemes axillary, solitary, 8-10-flowered, when in fruit they are about equal in length to the leaves; calyx 4-parted; leaves obovate-oblong, emarginate, cuneate at the base, coriaceous, puberulous beneath, shining above, and are as well as the branches glabrous. \( \tau \). Native on the banks of the Orinoco. *Myrtus margina*, H. B. et Kunth, nov. gen. amer. 6. p. 142. Flowers unknown. Berry nearly globose, pubescent, 1-seeded. Seed smooth. Cotyledons contortuplicate.

**Emarginate-leaved Eugenia.** Shrub or tree.

151. *Eugenia ludieind'java* (Bert. ined. ex D. C. l. c.) peduncles axillary, solitary, opposite, or in fascicles, panicked, shorter than the leaves; branches and flowers pubescent or villous; leaves ovate, acuminated, membranous, full of pellucid dots, glabrous in the adult state; calyx 4-cleft. \( \tau \). Native of St. Domingo. *Myrtus monticola*, Vahl. herb. ex Puer. Fruit globose, 1-seeded. Seed shining, pseudo-mono cotyledonous.

**Sporting Eugenia.** Shrub or tree.

*Gregy's Eugenia.* Cilt. 1776. Tree 30 to 40 feet.

**Fragrant Eugenia.** Fl. April, May. Chl. 1770. Tree 20 ft. 154. *Eugenia virguliflora* (D. C. l. c.) racemes axillary and terminal, puberulous, somewhat compressed, shorter than the leaves; pedicles rather remote, decessive, bibracteolate at the base; leaves oval-oblong, acuminated at both ends, rather opaque, and are as well as the branches glabrous, shining above, and marked with impressed dots and veins. \( \tau \). Native of the high mountains of Jamaica, Santa Cruz, &c. *Myrtus virguliflora*, Swartz, fl. ind. occ. 2. p. 905. exclusive of the synonyme of Plumier. Vahl. symb. 2. p. 58. Berry roundish, rather dry. Seeds 2-3, angular.

**Twiggly Eugenia.** Fl. July, Aug. Chl. 1787. Tr. 12 to 15 ft. 155. *Eugenia bifaria* (Wall. pl. asial. var. 2. p. 47. t. 161.) arborescent, quite smooth; leaves oblone, acuminated, approximate, on short petioles, spreading in a bifarious manner, shining, blistered above, and transversely nervd beneath, with the anastomosing vessels very conspicuous, and forming 2 marginal veins, which are remote from the margin; corymb axillary, solitary, branched; ovaryovum clavate, on a slender pedicel; petals orbicular, pubescent; berry oval, crowned by the permanent lobes of the calyx, which are incurved. \( \tau \). Native of the mountains of the confines of Silhet.

**Bifarious-leaved Eugenia.** Tree 30 feet.

156. *Eugenia parviflora* (Lam. dict. 3. p. 200. exclusive of the synonyme of Rheedea) peduncles axillary, a little shorter than the leaves, panicked, pubescent; bracteas oval, foliaceous, under the branchlets of the panicle; bracteas linear, under the flowers; leaves elliptic-oblong, acuminated, opaque, rather dotted, glabrous above, pubescent beneath as well as on the branchlets. \( \tau \). Native of Java. *Myrtus parviflora*, Spreng. syst. 2. p. 485. Calyx clothed with white down; lobes 4, obtuse. Flowers small. Embryo like that of *Myrtus communis*, ex Kunth.

**Small-flowered Eugenia.** Shrub or tree.

157. *Eugenia nigricans* (D. C. prod. 3. p. 281.) peduncles axillary, length of the petioles, bearing 8-10 slender, 1-flowered pedicels, which are twice the length of the petioles, disposed in the manner of a raceme; bracteas small, under the flowers and at the origin of the pedicels; leaves elliptic-oblong, long-acuminated, full of pellucid dots, reticulatd, glabrous on both surfaces as well as the branchlets, which are compressed. \( \tau \). Native of Brazil, in the province of Rio Negro, near Ega. *Myrtus Egensis*, Mart. herb. Leaves 4 inches long, and an inch broad. Pedicels 7 lines long. Peduncles or rachis 3-4 lines long. Fruit larger than a pea, globose, 1-seeded. Seeds globose. Imma ture embryo pseudo-mono cotyledonous.

**Ega Eugenia.** Tree.

158. *Eugenia acutiloba* (D. C. l. c.) racemes axillary, simple, 7-flowered, shorter than the leaves, and are as well as the branches rather hairy; lobes of calyx and bracteas rather acute; leaves oval-oblong, attenuated at the base, acuminated at the apex, full of pellucid dots, rather villous on the upper surface when young, but glabrous in the adult state, dotted, paler beneath, and pubescently villous. \( \tau \). Native of Jamaica. Intermediate between *E. virguliflora* and *E. parviflora*. Fruit unknown.

**Acute-lobed Eugenia.** Shrub 6 to 10 feet.

159. *Eugenia racemiosa* (D. C. prod. 3. p. 281.) racemes axillary, simple, 7-8-flowered, clothed with villous tomentum, much shorter than the leaves; bracteas and bracteoles small, acute; calycine lobes 4, roundish; leaves oval-lanceolate, long-acuminated, with a few pellucid dots, clothed with adpressed villi when young, but glabrous in the adult state, shining above. \( \tau \). Native of Brazil, in woods. *Myrtus racemosa*, Mart. herb. Leaves 3 inches long, and 12-15 lines broad. Racemes 9-10 lines long. Petals obovate. Style acule, longer than the stamens. Fruit unknown.

**Racemose-flowered Eugenia.** Shrub or tree.
MYRTACEÆ. XXXIII. EUGENIA.

160. *E. Candollea* (D. C. I. C.) peduncles axillary, opposite, and terminal, tern, racemose, 7-9-flowered, shorter than the leaves; bracteoles bluish; leaves oval-oblong, rather cuticulated at the base, bluntly acuminate at the apex, full of pellicid dots, quite glabrous on both surfaces as well as on the branches. *E. S.* Native of Brazil, in woods near Rio Janeiro. Myrtus Candollea, Mart. herb. Leaves 2 inches long and 9-10 lines broad. Peduncles 9-10 lines long. Fruit ovate, crowned by the lobes of the calyx, which are ovate, obtuse, 4 in number, and glabrous as well as the whole inflorescence.

*De Candolle's Eugenia.* Shrub or tree.

161. *E. collina* (D. C. I. C.) peduncles extra-axillary, racemously panicked, shorter than the leaves, or equal in length to them; lobes of calyx 4, ovate, obtuse, spreading reflexed; staminiferous disk broad; leaves elliptic, bluish, stiff, opaque, and as well as the branchlets glabrous. *E. S.* Native of Brazil, on hills. Myrtus collina, Mart. herb. Peduncles rising a little above the leaves, opposite, and forming a cross angle with the leaves. Calyces downy, expanded like that of *Psidium*, but 4-lobed, and with the lobes distinct in the bud. Leaves 2 and 2½ inches long and 1 inch broad. Peduncles an inch and a half long. Fruit unknown.

*Hill's Eugenia.* Shrub or tree.

162. *E. caparidifolia* (D. C. I. C.) peduncles axillary, racemose, 3-times shorter than the leaves, 7-8-flowered; bracteas and bracteoles ovate; fruit ovate, globose, glabrous at length, but when young clothed with short velvety down, as well as the lobes of the calyx, which are 4 and ovate; leaves oval oblong, bluntish, coriaceous, stiff, opaque, and as well as the branchlets glabrous. *E. S.* Native of Brazil, on Serro Frio, in the province of the Mines. Myrtus caparidifolia, Mart. herb. Leaves 2½ inches long and 9-10 lines broad. Racemes 8-10 lines long. Fruit larger than a pea, 1-seeded. Cotyledons con- 

*Conifera-leaved Eugenia*. Shrub or tree.

163. *E. fima* (D. C. prod. 3. p. 282.) peduncles axillary, racemose, simple, shorter than the leaves; bracteas and bracteoles small, broad, hardly acute; fruit globose, 2-seeded, crowned by the 4 ovate, erect lobes of the calyx; leaves ovate, bluntish, stiff, opaque, glabrous on both surfaces as well as the branchlets and racemes. *E. S.* Native of Brazil. Myrtus firma, Mart. herb. Leaves 3-4 inches long and from 1-2 broad, on short petioles. Racemes 2 inches long. Fruit size of a cherry, of an orange colour.

*Firm Eugenia.* Shrub 6 to 10 feet.

164. *E. inezulora* (D. C. I. C.) peduncles axillary, disposed in a many-flowered, terminal panicle; calyx 4-lobed, the 2 larger lobes membranous, roundish and ciliate; leaves elliptic, somewhat attenuated at both ends, rather coriaceous, opaque, and as well as the branches glabrous. *E. S.* Native of Cayenne. Leaves 2½ inches long and an inch broad, shining above. Flowers small. Fruit globose. Seeds roundish. Cotyledons con- 

*Unequal-lobed-calyxed Eugenia*. Shrub 6 to 8 feet.

*Sea-side Eugenia*. Shrub 6 to 10 feet.

166. *E. micrantha* (D. C. I. C.) racemes 1-2, axillary, or 2-3, terminal, usually 10-flowered, shorter than the leaves, and as well as the branchlets and calyces rather hairy; leaves rather ovate-oblong, acuminate, cuneate and acute at the base, revolute all round, rather coriaceous, glabrous, and rather shining. *E. S.* Native of New Granada, near Honda, and perhaps of Peru. Myrtus mirandana, H. B. et Kuhn, l. c. p. 114. but not of Nees nor Mart. *Ovarium* 2-celled; cells many-ovulate. Fruit red, 1-seeded.

*Small-flowered Eugenia.* Shrub 6 to 10 feet.

167. *E. micrantha* (Humb. et Bonpl. pl. equin. 2. p. 107. t. 113.) racemes axillary, solitary, shorter than the leaves, or terminal, in threes, 8-10-flowered, and as well as the branchlets clothed with silky silvery down; calyx acutely 4-lobed; leaves oblong-lanceolate, acuminate, narrowed at the base, coriaceous, glabrous above and shining, but covered with silky silvery down beneath. *E. S.* Native of New Granada, on mountains near Fusagasuga. *Ovarium* 2-celled; cells many-ovulate. Seed subglobose. Cotyledons fleshy, con- 

*Whith Eugenia.* Tree 12 to 15 feet.

*Pubescent Eugenia*. Shrub or tree.

169. *E. pseudo-carpyophyllus* (D. C. I. C.) peduncles axillary, alternate, twice trifid at the apex, shorter than the leaves; and as well as the calyces, branchlets, and buds, clothed with hoary pubescence; leaves oblong-obtuse, acuminate at both ends, stiff, opaque, glabrous above and shining, clothed with canescent silky down beneath. *E. S.* Native of Brazil, in the province of St. Paul. Myrtus oleaster, Mart. herb. *Myrtus pseudo-carpyophyllus*, Gomez. mem. act. lisp. 3. p. 33. t. 6. ex St. Hil. Leaves 3 inches long and 9-10 lines broad. Petioles 2 lines long. Fruit ovate, crowned by the lobes of the calyx, obtuse, somewhat inflexed. Peduncles 1½ inch long.

*Var. ß. ococtoides* (D. C. I. C.) peduncles axillary, and almost terminal, trichotomous, coriaceous; flowers 4-cleft, middle one sessile, lateral ones pedicellate; leaves elliptic-oblong, acuminate, feather-nerved, glabrous above, and rather canescent from short silky adpressed down beneath; young branches puberulous. *E. S.* Native of Brazil. Fruit and seeds unknown.

*Bastard-clove Eugenia*. Tree 15 to 20 feet.

170. *E. fulvescens* (Mart. herb. ex D. C. prod. 3. p. 283.) peduncles axillary, and nearly terminal, panicked, and trichotomo- 

ous; flowers 4-cleft, middle one sessile, lateral ones pedicellate; leaves elliptic-oblong, acuminate at both ends, feather-nerved, glabrous above, rather velvety beneath from short pubescent down, as well as branchlets and peduncles; branches compressed. *E. S.* Native of Brazil, in fields in the provinces of the Mines. Very like *E. pseudo-carpyophyllus var. Ococtoides*, but the leaves are shorter, and not silky beneath.

*Pubescent Eugenia*. Shrub or tree.

171. *E. patens* (Poir. suppl. 3. p. 124.) racemes axillary, rather spreading, many-flowered, ultimate ones panicked; lobes of calyx 4, orbicular, 2 of which are smaller than the other 2; leaves lanceolate, acuminate, spreading, coriaceous, full of pellicid dots, and are, as well as the branches, glabrous. *E. S.* Native of Cayenne. Racemes a little shorter than the leaves. Bracteoles 2, ovate, obtuse under the calyx. Stamens a little longer than the petals. Fruit unknown.

*Spreading Eugenia*. Shrub or tree.
MYRTACEÆ. XXXIII. Eugenia.

172 E. Mikaniana (D. C. prod. 3. p. 283.) peduncles axillary, opposite, and nearly terminal, divaricately branched, longer than the leaves, and are, as well as the calyces and branches, clothed with rufous tomentum; leaves ovate-oblong, acuminate, full of pellucid dots when young, villous and rather tomentose above, but in the adult state opaque, glabrous above, and almost naked beneath. ½ S. Native of Brazil, in the province of St. Paul. Myrtus Mikaniana, Mart. herb. Fruit ovate, crowned by the 4 lobes of the calyx, which are blunt and conviving. Leaves 2 inches long and 9 lines broad, on petioles a line long. Allied to E. rufescens, but the inflorescence is different.

Mikan's Eugenia. Tree 20 feet.

173 E. Acetosans (Poir. suppl. 3. p. 125.) racemes axillary and terminal, pedunculate, longer than the leaves; pedicels opposite; flowers 4-cleft; leaves ovate-oblong, acute at both ends, opaque, membranous, glabrous in the adult state. ½ S. Native of Guiana. Leaves with an acid taste according to Richard. Myrtus acetosans, Spreng. syst. 2. p. 488. Fruit and seeds unknown.

Avid-leaved Eugenia. Tree.

174 E. Aegrinea (D. C. l. c.) peduncles axillary and terminal, many-flowered, racemously panicked, shorter than the leaves; calyces and panicles covered with rufous velvety down; pedicels opposite, 1-5-flowered; calyx 4-cleft; leaves oval-oblong, acute at both ends, opaque, membranous, glabrous in the adult state. ½ S. Native of South America. Myrtus aegrinea, Forsyth in herb. Lher. Petioles 5 lines long. Leaves 3 inches long and 12-15 lines broad. Racemes an inch and a half long. The two broadest lobes of the calyx are blunter. Fruit and seeds unknown.

Rusty Eugenia. Shrub or tree.

175 E. Muricata (D. C. l. c.) peduncles axillary and terminal, racemose, shorter than the leaves; bracteas small, acute under the flowers; fruit ovate, rough from blunt tubercles, crowned by the 4 lobes of the calyx, which are obtuse and spreading; leaves elliptic-oblong, acuminate, opaque, rather coriaceous, glabrous above, but clothed with paler rufous down beneath, pubescent while young, but glabrous in the adult state. ½ S. Native of Brazil. Myrtus muricata, Mart. herb. Leaves 6 inches long and 2 inches broad. Petioles 2-3 lines long. Racemes 3 inches long when in flower, but when bearing the fruit they are from 4-6 inches long. Allied to E. riparia. Seeds unknown.

Muricataed-Fruited Eugenia. Tree 20 feet.

176 E. Riparia (D. C. l. c.) peduncles axillary and terminal, shorter than the leaves, racemously panicked; bracteas under the flowers, broad at the base, and acute at the apex; calyces, peduncles, and branchlets, covered with rufescent down; leaves elliptic-oblong, terminated by a long acute acumen, coriaceous, opaque, nerveless, clothed with rufescent down beneath. ½ S. Native of Brazil, on the banks of the river Amazon. Myrtus riparia, Mart. herb. Leaves 5 inches long and 2 inches broad, standing on petioles 2 lines long. Petiole 2-3 inches long. Calyxes lobes 4, spreading, rounded. Staminiferous disk broad, as in Psidium. Fruit unknown.

River-side Eugenia. Tree 20 feet.

177 E. Hirsuta (Ruiz et Pav. fl. per. 4. t. 417. a.) peduncles leath, few-flowered; pedicels 1-flowered, having 2 leafy bracteas in the middle, and each flower is surrounded by 5 bracteas in the form of an involucre; leaves ovate, acuminate, with revolute margins, on very short petioles; fruit oblong, small, crowned by the 5-lobed limb of the calyx, ex icon. ½ S. Native of Peru. Hairy in every part. Style subulate.

Hairy Eugenia. Shrub 6 to 8 feet.

178 E. Florida (D. C. l. c.) peduncles axillary or terminal, pedicled, many-flowered, longer than the leaves; bracteole acut, 2 under each flower, and a solitary one at the base of each pedicel; petals obvate, spreadingly reflexed; leaves elliptic-oblong, acuminate, membranous, opaque, nearly veined above, and are, as well as the branchlets, glabrous. ½ S. Native of Brazil, on the banks of the river Amazon. Myrtus floridia, Mart. herb. Flowers as large as those of Myrtus communis. Style exserted. Calyx lobes 4; obtuse. Fruit unknown.

Florid Eugenia. Tree 20 to 50 feet.

179 E. Levigata (D. C. prod. 3. p. 283.) peduncles axillary and terminal, much branched, covered with rufous down, as well as the flowers and buds; leaves oval-oblong, attenuated at the base, bluntly acuminated at the apex, opaque, smooth above, pale and dotted beneath, glabrous on both surfaces, as well as on the branchlets. ½ S. Native of Brazil, in the desert of Rio St. Francisco. Myrtus levigata, Mart. herb. Leaves 2 inches long and 8-9 lines broad, standing on petioles 3 lines long. Flower-bud globose. Fruit unknown.

Smooth Eugenia. Shrub or tree.

180 E. Patula (D. C. prod. 3. p. 284.) peduncles axillary or terminal, racemose, simple, 5-7-flowered, shorter than the leaves; pedicels spreading, distant; bracteas and bracteoles small, acute; lobes of calyx obtuse; leaves linear-oblong, acuminated, with a few pellucid dots; branchlets and racemes quit glabrous. ½ S. Native of Brazil, at the river Amazon. Myrtus patula, Mart. herb. Leaves 4-5 inches long and 5-10 lines broad. Petioles 2 lines long. Tube of calyx globose. Flowers small.

Spreading Eugenia. Tree 20 to 30 feet.

181 E. Ruditcosa (Ruiz et Pav. fl. per. 4. t. 416.) peduncles racemose, aggregate in the axis of the leaves, and terminal, panicked, numerous, about the length of the leaves; leaves oval-oblong, acuminated; fruit globose, rough. ½ S. Native of Peru.

Rough-fruited Eugenia. Tree.

182 E. Patellens (D. C. l. c.) peduncles terminal, twin, racemose; pedicels opposite, for the most part one-flowered, furnished each with one bractea at the base, and 2 bracteoles at the apex; calyces 4-cleft, clothed with cinereous villi; leaves broad-lanceolate, attenuated, dotted above, and are, as well as the branchlets, glabrous. ½ S. Native of South America. Myrtus patentella, Vahl. symb. 2. p. 57. Spreng. syst. 2. p. 485; exclusive of the synonyme of Poiret, which is referrible to Calyptrites thyrsiflorus. Branches rather compressed above. Petals very minutely ciliated, length of the stamens. Fruit and seeds unknown.

Pale Eugenia. Tree.

183 E. Nervosa (Lour. cochin.) peduncles 1-flowered, terminal, crowded; calyx 4-lobed; lobes obtuse, concave; leaves lanceolate, glabrous. ½ G. Native of Cochinchina, in woods. Myrtus Leuril, Spreng. syst. 2. p. 489. Petals small, roundish. Stamens above in number, 3 times longer than the petals. Style subulate, acute, longer than the stamens. Berry globose, nervored, glabrous, reddish brown.

Nerved-leaved Eugenia. Tree 30 to 40 feet.

184 E. Corymbosa (Lam. dict. 4. p. 199.) peduncles terminal, corymbose, with opposite branchlets; calyx with 4 short teeth; leaves ovate, obtuse, opaque, shining above, veined beneath, glabrous on both surfaces, as well as on the branchlets. ½ S. Native of the East Indies. Njara, Rheed. mal. 5. p. 53. t. 27. Berry globose, blackish, 1-seeded, ex Rheed. Corymbose-flowered Eugenia. Tree.

185 E. Androseomoides (D. C. l. c.) racemes terminal and axillary, somewhat corymbose, few-flowered, shorter than the leaves; leaves oval, obtuse, stiff, coriaceous, opaque, nearly sessile, glabrous; branches tetragonal. ½ S. Native of the East.

Androsaemum-like Eugenia. Shrub.

186 E. ? pendula (D. C. I. c.) racemes terminal, elongated, pendulous; branches short, usually 3-flowered; calyces semi-quadrifid; leaves on short petioles, oblong-lanceolate, attenuated at both ends, glabrous. ψ. S. Native of Java, in woods in the province of Bantam. Myrtus pendula, Blum. bijdr. p. 1085. Said to be allied to E. lanceolata.

Pendulous-racemed Eugenia. Shrub.

187 E. Stigmflora (Nees et Mart. nov. act. bonn. 12. p. 52.) peduncles compressed, rising from the stem; flowers spicate, opposite, tribracteolate; leaves oblong-lanceolate, acuminate, ciliated, hairy on the stem and petioles. ψ. S. Native of Brazil, at the river Ilheos. Leaves a hand long. Petioles covered with yellow bristles. Tube of calyx funnel-shaped. Fruit and seeds unknown. Said to be allied to E. Brasiliensis.

Spicate-flowered Eugenia. Shrub 10 to 18 feet.

188 E. ? lanceolata (Lam. dict. 3. p. 200.) peduncles nearly terminal, racemose, few-flowered; calyx turbinate, 4-lobed; leaves lanceolate, nearly sessile, full of pellucid dots, glabrous on both surfaces, as well as on the branchlets. ψ. S. Native of the East Indies. Myrtus Sonneratii, Spreng. syst. 2. p. 485. Petals concave. Stamens, fruit, and seeds unknown.

Lanceolate-leaved Eugenia. Shrub 6 to 12 feet.

189 E. T. emu (Hook. in Beech. voy. pt. bot. p. 56.) panicles axillary, for the most part solitary, somewhat corymbose, few-flowered, almost the length of the leaves; leaves elliptic or obvate, very blunt, coriaceous, pale beneath, when young rather velvety, as well as the branchlets, on short petioles. ψ. G. Native of Chili, about Valparaiso, Temu of Chili. Perhaps the same as Myrtus Luma of Molinia.

Temu Eugenia. Shrub 5 to 6 feet.

Bush Eugenia. Shrub 6 to 10 feet.

191 E. axillarum; racemes axillary, exceeding the pendulous petioles, covered with adpressed pubescence; peduncles bifracteolate at the apex, puberulous; leaves lanceolate, bluntly acuminated, glabrous, dotless; tops of branches and petioles beset with small down, the rest of the plant glabrous. ψ. S. Native of Mexico, in woods near Jalapa. Myrtus axillaris, Moc. et Sesse. Flowers small.

Axillary-flowered Eugenia. Shrub.

192 E. verruculosa (D. C. I. c.) panicle terminal, elongated; bracteas and bracteoles, as well as the lobes of the calyx, broad, short, and obtuse; fruit large, spherical, covered with dotted warts, crowned by the spreading lobes of the calyx; leaves elliptic, attenuated at the base, acuminated at the apex, stiff, opaque, shining above, almost veinless, quite glabrous on both surfaces, as well as on the branchlets. ψ. S. Native of Brazil, at the river Tapura. Myrtus verruculosa, Mart. herb. Leaves 3-4 inches long and 15 lines broad. Petioles 2 lines long. Fruit 7 lines in diameter. Seed one, pseudo-monocotyledonous.

Warted-fruited Eugenia. Shrub or tree.

193 E. Tabasco; cymes nearly sessile, lateral; leaves elliptic-lanceolate, acute at the base, and obtuse at the apex, full of pellucid dots; berry globose; limb of calyx bluntly 4-lobed, having the lobes conniving; fruit 1-celled and 1-seeded from abortion; embryo spirally convoluted; branches tetragonally winged. ψ. S. Native of Mexico, in hot regions. Myrtus Tabasco, Moc. et Sesse, ex Cham. et Schlecht. Linnaea. 5. p. 559. Myrtus Pimента and Pimenta de Tabasco de los Mexican. The seeds are used as a condiment.

Tabasco Pimenta. Tree.

194 E. Microcarpa (Cham. et Schlecht. in Linnaea. 5. p. 560.) glabrous; branches dichotomous; leaves on short petioles, acute at the base, and drawn out into a blunt acumen at the apex, shining above, and paler beneath, full of pellucid dots; berries glomerate at the tops of the branches, on short bibracteolate peduncles, crowned by 4 very blunt segments; flesh spongy, thick; cotyledons confruminated; seed one. ψ. S. Native of Mexico, in woods near Jalapa. Flowers not seen.

Small-fruited Eugenia. Tree.

195 E. Marginata (Pers. ench. 2. p. 17.) peduncles axillary and almost terminal, trifid, trichotomous; tube of calyx glabrous, with 4 very blunt lobes; leaves ovate, acute, besprinkled with a very few pellucid and red glands, shining above, beset with impressed dots beneath, but with elevated ones above, glabrous on both surfaces in the adult state; branches terete, clothed with rusty villi at the tops. ψ. S. Native of St. Domingo. Perhaps the same as Myrtus marginata, Spreng. syst. 2. p. 438. Marginated-leaved Eugenia. Shrub or tree.

196 E. Pimenta (D. C. prod. 3. p. 83.) peduncles axillary and terminal, trichotomously paniced; flowers 4-cleft, those in the forks almost sessile, the rest paniced; leaves oblong or oval, full of pellucid dots, rather opaque, glabrous; branches terete; branchlets compressed, pubescent when young, as well as the pedicels. ψ. S. Native of the Caribbean Islands, Jamaica, &c., and now cultivated in the East Indies. The upper leaves are rarely somewhat alternate, the rest opposite. Brac- teoles 2 under each flower, falling off very late. Berry globose, 1-seeded. Embryo roundish. Cotyledons confruminated, not distinct. Bayberry tree, Hugh. barb. p. 145. t. 10. good. ex Sims, bot. mag. 1236. Myrtus Pimenta, Lin. spec. 676. Swartz. obs. p. 202. Soon after the pimenta trees have blossomed the berries become fit for gathering, without being suffered to ripen, as when ripe they are moist and glutinous, and therefore difficult to cure, and when dried become black and tasteless. The berries are dried by spreading them on a terrace exposed to the sun for about 7 days, during which time they gradually lose their green colour, and become of a reddish brown. The smell of them resembles a mixture of cinnamon, cloves, and nutmegs; their taste approaches to that of a mixture of the whole three; whence the tree has received the name of all-spice. Newmann ascertained that its flavour resides entirely in a volatile oil heavier than water, and its pungency is a resin or a substance soluble in alcohol, and insoluble in water. Pimenta is a warm aromatic stimulant, and is much used as a condiment in dressing food. As a medicine it may be advantageously substituted for the more costly spices. An oil is obtained by distillation, which is said to be nearly equal to oil of cloves, and is sometimes substituted for it.

Var. a, longifolia (D. C. I. c.) leaves oblong-lanceolate, bluntly acuminated.—Pluk. t. 155. f. 4.

Var. β, ovatifolia (D. C. I. c.) leaves oval, shorter, obtuse.—Sloane, hist. jain. 2. t. 191. f. 1. Perhaps referrible to Myrica pimentoides, and probably the Myrtus aromatica of Poir. dict. 4. p. 410. and is therefore perhaps a species of Myrica.

Pimenta, or Jamaica All-spice, or Jamaica Pepper. Fl. May, July. CI. 1725. Tree 20 to 30 feet.

197 E. cneorobalanoides (D. C. I. c.) peduncles terminal, exceeding the leaves; pedicels oppo.-ite, 1-flowered; bracteas and bracteoles ovate, concave, dotted; flowers 4-cleft; leaves
broad, oval, obtuse or acuminated, full of pellucid dots, and are as well as the branches glabrous. ½ S. Native of Guadaloupe. Branches terete. Petioles 5 lines long. Leaves 2-3 inches long and 1 or 2 inches broad. Pedicles rather downy. Calyx large, dotted. Fruit and seeds unknown.

**Cocoa-plum-like Eugenia.** Shrub 6 to 10 feet.

198 E. nitens (D. C. 1. c.) peduncles terminal, somewhat trichotomous at the apex; leaves elliptic-lanceolate, acute at the base, and bluntish at the apex, shining above, and full of pellucid dots beneath, and are glabrous as well as the branches. ½ S. Native of the Mauritius. Myr'tus nitens, Poir. suppl. 4. p. 51. Fruit 3-4-celled. Flowers 4-cleft, ex herb. mus. par. Seeds unknown.

**Shining Eugenia.** Shrub or tree.

199 E. {Berteriana} (Spreng. syst. 2. p. 487.) panicle terminal; flowers crowded, 4-cleft; leaves oblong-lanceolate, acuminated, shining above, and quite glabrous beneath. ½ S. Native of South America, at the river Magdalenum. Myr'tus Berteriana, Spreng. syst. 2. p. 487. The rest unknown.

**Berteroa's Eugenia.** Shrub or tree.

200 E. pyriforma (Desv. in Ham. prod. fl. ind. occ. p. 44.) panicle brachiate, terminal, many-floated; racibus pubescent; leaves on short petioles, ovate, acuminated, nerved. ½ S. Native of Guiana. The rest unknown.

**Pear-leaved Eugenia.** Shrub or tree.

† *Species of Eugenia not sufficiently known.*

201 E. acuminate (Link, enum. 2. p. 28.) ½ S. Native country, flowers, and fruit unknown. Leaves acuminated.

**Acutinament-leaved Eugenia.** Shrub or tree.

202 E. umbellata (Spreng. neut. entd. 2. p. 169.) pedicels 1 flowered, umbellate; leaves oblong, obtuse, opaque. ½ S. Native of Brazil. The rest unknown. A very doubtful species. **Umecellate-flowered Eugenia.** Shrub or tree.

203 E. ramiflora (Desv. in Ham. prod. fl. ind. occ. p. 43.) pedicels short, clothed with rufus tomentum; calyx clothed with hoary tomentum; branches divaricate, glabrous; leaves on short petioles, oblong-lanceolate, acuminated, shining above, and rather tomentose beneath. ½ S. Native of Guiana. Flowers 4-cleft. The rest unknown.

**Branch-flowered Eugenia.** Tree 15 to 20 feet.

204 E. trunciflora; glabrous; leaves nearly sessile, oblong, acuminated, acute, obtuse at the base, rather coriaceous, full of pellucid dots; flowers rising in fascicles from the trunk, 4-cleft, ecaudandrous; ovary 2-celled; cells at 15-ovulate; ovula fixed to the middle of the dissepiment. ½ S. Native of Mexico, in shady woods between Mesochia and Papantla. Leaves 5-7 inches long and 2 or 2½ broad. Petioles thick, a line long. Peduncles 3-9 lines long, furnished with 2 scale-formed bracteas under each flower. Flower-bud globose, size of a pea. Flowers white, more than half an inch in diameter when expanded. Myr'tus trunciflora, Cham. et Schlecht. in Linnaea. 5. p. 501.

**Bitter-flowered Eugenia.** Shrub.

N. B. There are numerous names of species in Roxburgh's Hortus Bengalensis, but all without descriptions.

**Eugenia villosa, Poir. suppl. 3. p. 124.** or Myr'tus villosa, Spreng. syst. 2. p. 487. is obviously the Monimia rotundifolia, Pet. Th. or Ambôra tomentosa, Bory; a plant belonging to Urticaceae.

**Eugenia violacea, Lam. dict. 3. p. 200.** is evidently a Rubia-cous plant, and perhaps an *Ezora* mixed with the leaves of a species of Syzygium in M. Jessieu's herbarium.

**Cult.** For culture and propagation see *Jambosa*; p. 869.

***MYRTACEÆ.*** ***XXXIII. EUGENIA.*** ***XXXIV. JAMBOSA.***

XXXIV. JAMBOSA (altered from *Sehambou*, the Malay name of the species). Rumph. amb. 1. p. 121.—D. C. prod. 3. p. 286.—Jambos, Adans, fam. 2. p. 88.—Eugenia species, Swartz, Kunth.

**Lin. syst. Jessandria, Monogynia.** Tube of calyx tubinarian (f. 124. a.), attenuated at the base, having the throat drawn out beyond the ovary, dilated and obovate; limb 4-cleft; lobes roundish. Petals 4, inserted in the throat of the calyx, broad, concave, obtuse. Stamens very numerous (f.124. b.), longer than the petals, free, straight. Style filiform; stigma simple, acutish. Ovarium many-celled, many-ovulate. Fruit 1-2-seeded, fleshy from the large bacate calyx, umbilicate at the apex. Seed angular. Cotyledons fleshy, thick, with coniferomarginate margins. Radicle almost cylindrical, hidden between the cotyledons.—Indian trees, with opposite leaves, standing on short petioles, and full of pellucid dots. Cymes lateral and terminal, few-colored, simple, much shorter than the leaves; pedicels lateral, opposite, and one terminal. Flowers large, bracteate, articulated on the tops of the pedicels. Fruit large. The greater part of the species being cultivated for the sake of their fruit are therefore difficult to extricate from confusion.

1 J. vulga'ris (D. C. prod. 3. p. 286.) racemes cymose, terminal; leaves narrow-lanceolate, attenuated at the base, acuminated at the apex. ½ S. Native of the East Indies, and now cultivated in all the regions within the tropics. Malacca-Sambhoo, Rheed. mal. 1. t. 17. Eugenia Jambos, Lin. spec. p. 672. Sims, bot. mag. 1696. E. Jamboo, Roxb. hort. beng. p. 38.—De laur. herb. amat. t. 77. Thouin, ann. mus. 1. p. 35. Myr'tus Jambos, H. B. et Kunth, nov. gen. amer. 6. p. 158. Leaves 6-7 inches long and 1 to 1½ inch broad. Fruit ovate-globose. Flowers white. The *Janssorade* or *Rose-apple* is a branching tree, about 30 feet high. The fruit is pear-shaped, about the size of a medlar, white, red, or rose-coloured, and ripening from September to December. There are several varieties differing in the size and colour of the fruit. It is not so much esteemed as the Malay-apple; it is however nevertheless excellent, resembling in appearance and flavour a Brussels apricot. To grow the fruit in this country, it requires a hot and moist atmosphere. **Common Janssorade or Rose-apple.** Fl. Feb. July. Clt. 1768.

Tree 20 to 30 feet.

2 J. samarangensis (D. C. 1. c.) racemes loose, terminal or axillary, shorter than the leaves; branches usually 3-flowered; leaves elliptic-oblong, hulmish, rounded at the base, or nearly cordate, glabrous. ½ S. Native of Java. Myr'tus Samaran'gensis, Blum. bijdr. p. 1054. Flowers rose-coloured or whitish. Leaves acutish, greyish green beneath. Perhaps sufficiently distinct from the following. **Samarang Rose-apple.** Tree 20 to 25 feet.

3 J. venosa (D. C. 1. c.) racemes simple, terminal, or sub-corynose, few-flowered; leaves elliptic, coriaceous, opaque, glabrous above, surfaces, and reticulately veined; branches angular. ½ S. Native of Madagascar and of the Maurits. Eugenia venosa, Lam. dict. 3. p. 200. Myr'tus venósus, Spreng. syst. 2. p. 485. Leaves on short petioles, 4 inches long and 2 or 2½ broad. Fruit said to be 1-seeded. **Vein-y-leaved Rose-apple.** Tree 20 feet.

**Long-leaved Rose-apple.** Clt. 1820. Tree 20 to 30 feet.

5 J. purpurascens (D. C. 1. c.) leaves lateral, in fasciades; ½ S 2

6 J. Malacensis (D. C. l. c) cymes lateral, short; leaves ovate-lanceolate, attenuated at both ends. \( \varphi \) S. Native of the East Indies. Nati-Schambu, Rheed. mal. 1. t. 18. Eugenia Malaccensis, Lin. spec. p. 672. Lam. dict. 3. p. 196. Cor. ann. mus. 9. p. 292. t. 2. Myrurus Malaccensis, Spreng. syst. 2. p. 484. Leaves a foot long, shining. Fruit pear-shaped. Jambosa mira 1. t. 38. f. 1. Flowers white. This tree resembles the jamborade, but has broader leaves. The fruit is ovate, an inch and a half in diameter, fleshy, and sweet-scented like the rose, agreeable to the taste, smell, and sight, and esteemed wholesome. It is common in most of the islands in the South Sea.

**Stem-clasping-leaved Rose-apple.** Fl. May, July. Clt. 1823. Tree 20 to 30 ft.

**Southern Rose-apple.** Fl. April, July. Clt. 1800. Tree 20 ft.

9 J. Formosa; leaves elliptic-oblong, rather acuminate, sessile, cordate, stem-clasping; racemes axillary, rising after the leaves have fallen, sessile, short; pedicels clavate-elongated; flowers smooth; stamens very long; berry globose, pendulous. \( \varphi \) S. Native of the East Indies, at Moalmyne, and at the bottoms of the rocks on the banks of the Athan, in Martaban. Eugenia formosa, Wall. pl. rarr. asiat. 2. p. 6. t. 108. Calyx and petals reddish; filaments white. (f. 124.)

**Beautiful Rose-apple.** Tree 30 feet.

**Laurice-leaved Rose-apple.** Clt. 1823. Tree 20 to 30 ft.

11 J. Hypericifolia (D. C. l. c) pedicels terminal, solitary, 1-flowered, shorter than the leaves; leaves sessile, oblong-lanceolate, acuminate, rather cordate at the base, glabrous. \( \varphi \) S. Native of Java, on Monat Salak. Myrurus hypericifolia, Blum. bijdr. p. 1082. Calyx 4-cleft, rather attenuated at the base.

**St. John's-wort-leaved Rose-apple.** Shrub.

12 J. Owariensis (D. C. l. c) cymes peduncled, terminal; branchlets opposite, 3-flowered at the apex; calyxes turbinate, shortly and bluntly 4-lobed; leaves oval, acuminate, coriaceous, glabrous, rusty beneath. \( \varphi \) S. Native of the west coast of Africa, in the kingdom of Waree. Eugenia Owariensis, Beauv. fl. d'ouv. 2. t. 70. The veins of the leaves are parallel in the figure and rather prominent. Leaves 3 inches long and ½ broad. Stamens very numerous, exerted. Branches furnished with supra-axillary, opposite tubercles. Fruit unknown, but in the form of the calyx this plant agrees with Jambosa.

**Waree Rose-apple.** Tree 20 feet.

13 J. obtusissima (D. C. prod. 3. p. 287.) panicles corymous, terminal, or lateral; branches 5-flowered; calyx 4-cleft, attenuated at the base; leaves almost sessile, oblong, obtuse, somewhat cordate at the base, coriaceous, glabrous. \( \varphi \) S. Native of Java. Myrurus obtusissima, Blum. bijdr. p. 1085. Compare it with Eugenia androsanemoidei, ex Blume.

**Very obtuse-leaved Rose-apple.** Tree 20 to 30 ft.

14 J. Densiflora (D. C. l. c) corymb terminal, or axillary; pedicels 3-flowered; calyx 4-cleft, very much attenuated at the base; leaves oblong-lanceolate, coriaceous, glabrous, acuminate at both ends. \( \varphi \) S. Native by the sea-side, in the island of Nusa-Kambanga, in the East Indies, where it is called by the inhabitants Jambon. Eugenia densiflora, Blum. bijdr. p. 1087.

**Dense-flowered Rose-apple.** Tree 20 feet.

15 J. Glabra (D. C. l. c) peduncles filiform, 1-3-flowered, glabrous, shorter than the leaves; ovaryum clavate; calyx 4-cleft; leaves oblong-lanceolate, bluntly acuminate, finely veined, quite glabrous; calyx attenuated at the base. \( \varphi \) S. Native of Java, on the mountains. Myrurus glabra, Blum. bijdr. p. 1088. but not of Swartz.

**Smooth Rose-apple.** Tree.

16 J. Linearata (D. C. l. c) corymb terminal or axillary, compound; calyx 4-cleft; ovaryum elongated; leaves broad-lanceolate, bluntly acuminate, glabrous, with fine parallel veins, shining. \( \varphi \) S. Native of Java, in mountain woods, where it is called Kikangar. Myrurus linearata, Blum. bijdr. p. 1087. but not of Swartz.

**Lined-leaved Rose-apple.** Tree 20 feet.

17 J. Alba; racemes terminal and axillary; the terminal ones forming a panicle; peduncles 3-5-flowered; leaves very broad, elliptic, cordate at the base, strongly veined; petals very short. \( \varphi \) S. Native of the East Indies. Calycehe lobes broad, short, and rounded. Eugenia alba, Roxb. hort. beng. p. 37.

**White Rose-apple.** Tree.

18 J. Caulliflora (D. C. l. c) panicles lateral; flowers in nearly sessile glomerules; calyx 4-cleft, attenuated at the base; leaves sessile, oblong, bluntly acuminate, rather cordate at the base, coriaceous, glabrous, and shining. \( \varphi \) S. Native of Java, at the foot of Mount Burangrang, where it is called Kripa. Myrurus caulliflora, Blum. bijdr. p. 1086. but not of Mart.

**Stem-flowered Rose-apple.** Tree 20 to 30 feet.

19 J. Aqee (Rumph. amb. 1. p. 126. t. 30. f. 2.) panicles axillary and terminal; leaves elliptic-acuminate, auricled at the base, on very short pedioes; stigma simple. \( \varphi \) S. Native of the Moluccas. Eugenia aquae, Roxb. hort. beng. p. 37. Fruit torose, depressed.

**Watery Rose-apple.** Clt. 1820. Tree 20 to 30 feet.

17 J. Manchurica (Rumph. amb. 1. p. 121. t. 37.) racemes lateral; short; leaves ovate, acute; fruit obovate. \( \varphi \) S. Native of the Moluccas.

**Domestic Rose-apple.** Tree.
21 J. Hardwickia; leaves sessile, coriaceous at the base, elliptic, obtuse; corollas terminal; peduncles usually 3-flowered; flowers sessile on the peduncles; calcicorne segments roundish; stamens exerted. J. S. Native of the Mauritius. Perhaps a species of Jossinia (v. s. in herb. Lamb.).

Hardwickia’s Rose-apple. Tree.

22 J. rotundifolia; corollas terminal; leaves roundish, coriaceous, with revolute margins, reticulately veined, glabrous. J. S. Native of the Isle of France. Perhaps a species of Jossinia (v. s. in herb. Lamb.).

Round-leafed Rose-apple. Tree.

The Eugenia oblatata, E. lanceafolia, and E. lancodiaria of Roxb. hort. Beng. p. 37. are probably referrible to this genus, but they have not yet been described.

Cult. A genus of fine trees, with large foliage, beautiful flowers, and eatable fruit. They thrive well in a mixture of sand, loam, and peat; and flower freely when the plants are of good size. Ripened cuttings strike root readily in sand, under a hand-glass.

Tribe IV.

BARRINGTONIA (plants agreeing with the genus Barringtonia in important characters). D. C. Diett. class. vol. 11. not. 1826. prod. 3. p. 288. A genus of Lecythidaceae, Rich. et Poit. Lobes of calyx 4+5. Petals 4-6. Stamens inanemorous, equal, disposed in many series; filaments monadelphous a short way at the base. Fruit baccate or dry, valveless, many-celled. Cotyledons large and fleshy.—Trees. Leaves dotted, alternate, or nearly opposite, or in crowded whorls, quite entire or serrated. Flowers in racemes or panicles.

LIN. SYST. Monadelphia, Polyandria. Tube of calyx ovate; limb 2, rarely 3-parted; lobes oval, obtuse, concave, permanent. Petals 4, large, coriaceous. Stamens numerous, in many series; filaments filiform, long, free, but joined together into a short ring at the base; anthers roundish. Style filiform, length of stamens; stigma simple. Urcellos rising from the top of the ovarium, and sheathing the base of the style. Ovarium 4-celled; cells 2-ovulate. Berry large, ventricose at the base, pyramidal and tetragonal upwards, crowned by the limb of the calyx, 1-celled when mature; cell obversely pear-shaped, fibrous, almost pinnate. Seed ovate-globose, pendulous, attenuated upwards. Embryo exalbusinous (Blume), elliptic-globose, having its radicle superior, and confusis with the cotyledons, which are confrumented, and the embryo is therefore pseudo-monocotyledonous.—Large trees. Leaves crowched, opposite, or in whorls, dotted, obovate. Flowers large, disposed in a terminal thyrse; pedicela furnished with 1 bractea each.

Sheny Barringtonia. C1t. 1785. Tree to 30 to 40 feet.

Racemose-flowered Barringtonia. C1t. 1822. Tree to 30 to 40 ft. Cult. Most splendid trees, with large, shawly foliage and flowers, but difficult to cultivate. They require to be kept moist and warm, and the house in which they are grown should never be allowed to fall below 60° Fahr. A mixture of sand, loam, and peat is a good soil for them. Cuttings, taken off at a joint when the wood is ripe, planted in sand, with a hand-glass over them, root readily. The cuttings should not be stripped of any of their leaves.

LIN. SYST. Monadelphia, Polyandria. All as in Barringtonia, but differs in the limb of the calyx being 4-parted. Ovarium semi-bilocular; cells biobulata. Fruit oblong, tetragonal. Perhaps only a section of Barringtonia, according to Gáratín and Blume.

White-flowered Stravadium. Tree 20 to 30 feet.

Red-flowered Stravadium. C1t. 1822. Tree 20 to 30 feet.

Scarlet-flowered Stravadium. Tree 30 to 40 feet.

4 S. spicatum (Blum. in lit. ex D. C. prod. 3. p. 289.) leaves cuneate-oblong, acute, serrate; spikes filiform, pedunlous. J. S. Native of Java, in the province of Bantam, in the lower woods. Barringtonia spicata, Blum. bijdr. p. 1097. Calyx 4-cleft. The rest unknown.

Spike-flowered Stravadium. Tree.

5 S. exsceletum (Blum. in lit. D. C. prod. 3. p. 289.) leaves oblong, attenuated at both ends, finely serrulate; racemes compound, terminal; drupe oblong, tetragonal. J. S. Native of the Island of Nusa-Kambang, on the woods on the sea-shore. Barringtonia excelsa, Blum. bijdr. p. 1097. Tree 80 feet high. Calyx 4-cleft. The rest unknown.

Tall Stravadium. Tree 80 feet.

Cult. For culture and propagation see Barringtonia.

**LIN. SYST. Monadelphia, Polyanthrida.** Tube of calyx turbinate (f. 125. a.); limb entire, or 4-6-6-lobed. Petals 4-6-6 (f. 125. c.), ovate, nearly equal. Stamens numerous, monadelphous at the base, and somewhat adnate to the claws of the petals. Ovarium 4-6-celled; cells many-seeded. Style long. Stigma obtuse. Capsule ovate, or nearly globose, 3-6-celled, coriaceous, valveless, umbilicate from the vestiges of the calyx. Seeds few in each cell, ovate, clothed with coriaceous membranes, suspended by long plicate funicles, fixed to the central column. Embryo fleshy. Cotyledons 2, large, nearly equal, convex on the outside, and flat inside. Radicle obtuse, hardly prominent.—Trees. Leaves alternate, large, dotted, serrated, or quite entire, glabrous. Racemes terminal, few-flowered. Flowers bicarpellate, white and shewy.

1 G. Augustà (Lin. amen. acad. 8, p. 266. t. 5.) flowers of 8 petals; calyx entire, glabrous; leaves oblong-lanceolate, acuminate, much narrowed at the base, membranous, remotely and sharply toothed. S. Native of Surinam, Maranham; and of New Granada, near Turbaco, where it is called Membrillo and Baco, ex H. B. et Kunth. Pirigára superba, H. B. et Kunth, nov. gen. amer. 7, p. 261. Fruit unknown. Petals white. Stamens yellow. The flowers smell sweet, but the wood is extremely fetid. In Surinam it is used for hooks.

**August Gustavia.** Cl. 1794. Shrub 5 to 10 feet.

2 G. speciosa (D. C. prod. 3, p. 289.) flowers 6-petalled; calyx nearly entire, and are as well the pedicels and ovaria tomentose; leaves oblong-lanceolate, acuminate, quite entire, narrowed at the base, coriaceous. S. Native of New Granada at Mariquita, where it is called Chupa. Pirigára speciosa, H. B. et Kunth, nov. gen. amer. 7, p. 260. By eating the small fruit of this tree, the body becomes yellow, and after it remains 24 or 48 hours, nothing can erase the colour, according to Humb. and Bonpl.

**Sherry Gustavia.** Tree.

3 G. urceolata (Poir. mem. mus. 13, p. 156. t. 5.) flowers 6-7-petalled; calyx glabrous, with an entire margin; leaves oblong-lanceolate, obtuse, or acutish, membranous, remotely subserated on the margin. S. Native of French Guiana, where it is called Bois puant, because the wood becomes fetid after exposure to the air. Petals oval, obtuse, an inch long, white, rather rose-coloured on the outside. Fruit wingless. Wood fetid. (f. 125.)

**Urceolate-calycyd Gustavia.**

Tree.

4 G. iteroca (Poir. l. c. p. 158. t. 6.) flowers 6-petalled; calyxine lobes 6, permanent, girding the fruit; leaves oval-oblong, acuminate, rather coriaceous, quite entire, or hardly denticulated. S. Native of Guiana, at La Maza and Roura. Smaller than the first. Fruit depressed, girded by a circular wing or margin. In the specimens of Perrottet the leaves are quite like, but in the figure of Poit, they are somewhat denticulated.

**Wing-fruited Gustavia.** Tree 10 to 20 feet.

**Disdainful Gustavia.** Cl. 1823. Tree 20 feet.

6 G. brasiliiana (D. C. prod. 3, p. 290.) flowers 6-petalled; lobes of calyx 6, ovate, acutish, foliaceous, flat; leaves oval-oblong, acuminate, rather repandly toothed. S. Native of Brazil, on the banks of the river Amazon, near Garupa. G. fastuosa, Mach. herb. This plant differs from the preceding species in the leaves being ovate or oval-oblong, not obvolute, and in the bracteas on the peduncles being ovate-obtuse, not oblong, acute; lobes of calyx ovate. Fruit 6-ribbed, not roundish and yellow, nor cinerous.

**Var. y, minor (D. C. l. c.) flowers a little smaller; leaves a little narrower. S. Native of Para, in Brazil.**

**Brazilian Gustavia.** Tree 20 feet.

7 G. tetrapatela (Reusch. ex D. C. prod. 3, p. 290.) flowers 4-petalled; lobes of calyx 4, roundish, at length deciduous; leaves oblong-lanceolate, acuminate, serrated, attenuated at the base. G. Native of Cayenne, on Mount Courou. Pirigára tetrapatela, Anub. guian. I. p. 489. t. 192. This is perhaps the same as G. augista.

**Tetrapetalous Gustavia.** Tree 20 feet.

8 G. valida (D. C. l. c.) flowers 4-petalled; lobes of calyx 4, ovate, roundish; leaves clavate, acutish, denticulated. S. Native of Java, in woods, and in the island of Nusa-Kambanga. Pirigára valida, Blum. bijdr. p. 1096. Cotyledons foliaceous, according to Blume. Radicle very long, clavate, ascending.

**Strong Gustavia.** Tree 30 to 40 feet.

**Cult.** A showy genus, with large leaves and flowers. A mixture of loam, peat, and sand answers the species best; and ripened cuttings root freely, if planted in sand, with a hard glass over them, in a moist heat.

† Genera belonging to Myrtaceae, but are not sufficiently known. Most of them probably belong to the Tribe Myrtée.

**LIN. SYST. Icosianthria, Monogyünia.** Tube of calyx ovate; limb 4-toothed, acute, small. Petals? Stamens numerous. Drupe or berry globose or ovate, crowned by the calycine limb, 1-celled, 1-seeded, having the bark or rind fleshy and filled with aromatic oilly roundish; leaves cuneate-oblong, acutish, denticulated. S. Native of Guiana, with opposite, or nearly alternate, oval, entire leaves, which are acuminate at both ends, and full of pellucid dots. This genus is not sufficiently known.

1 C. moschatá (Anub. l. c. t. 205. f. 1.) fruit globose. S. Native of Guiana, where it is called Iea Catina. Fruit exhalting a scent like musk.

**Musk Catina.** Tree 50 feet.

2 C. aromatica (Anub. l. c. t. 203. f. 2.) fruit ovate, attenuated at both ends. S. Native of Guiana, where it is called Goyavaraná.

**Aromatic Catina.** Tree 40 feet.

**Cult.** For culture and propagation see Gustévia, p. 870.

**XXXIX. PETALOTOMA** (from petalon, petalos, a petal,
and (tome a section; in reference to the cut petals). D. C. prod. 3. p. 294. Diatomæ, Lour. coch. p. 296. but not of D. C.

Lin. syst. Icosandria, Monogynia. Tube of calyx campionate, baccate; limb 8-1c.; segments acute. Petals 6-8, with filiform claws, and roundish cut limbs. Disk fleshy, crenated. Stamens 16, inserted in the disk. Anters roundish. Style filiform; stigma 4-5-celled, with the lobes ovate, furrowed and spreading. Berry round, crowned, 1-seeded. — A tree, with brachiate branches. Leaves opposite, ovate, glabrous, quite entire. Racemes short, nearly terminal. Flowers copper-coloured. The affinity of this genus is doubtful, unless it agrees with Alangium, but differs from it in the leaves being opposite, in the stigma being 4-5-celled; stigmas and anthers roundish.

Cult. For culture and propagation, see Gustavía, p. 870.

Lin. syst. Icosandria, Monogynia. Tube of calyx tetragonal and hemispherical; limb 4-parted; lobes valvate in astivation, permanent, at length reflexed. Petals wanting. Stamens numerous, disposed in many series; filaments capillary, free. Style filiform; stigma 4-celled. Berry dry, hard, nucumentaceous, indehiscent, flat above, and bluntly tetragonal beneath, 4-celled; cells 1-2-seeded. — Tree. Leaves alternate, crowded on the branches, sessile, oval, attenuated at both ends, quite entire, obtuse, glabrous, nervled, dotless. Peduncles 1-flowered, in the axis of the upper leaves.

1 F. Mauritiana (Lam. 1. c.) G. Native of the Mauritius, where it is called Dais pranit. F. Borbonica, Reusch. The wood is a good substitute for walnut wood.

Mauritian Fedotia. Cl. 1827. Tree 15 to 20 feet.

Cult. For culture and propagation see Gustavía, p. 870.

XLII. COUPÔUI (Coupo-rama is the name given to the tree by the Indians of Guiana). Aubl. guian. suppl. p. 16. t. 377.

1 C. aquatica (Aubl. 1. c.) S. Native of Guiana. Leaves 20-22 inches long, and 9 inches broad. Fruit about the form and size of an orange.

Aquatic Coupou. Tree 60 feet.

Cult. For culture and propagation see Gustavía, p. 870.

Lin. syst. Monadelphia, Polyandria. Tube of calyx ovate; limb 4-parted (f. 126. b). Petals 4, ovate, concave, spreading. Stamens numerous; filaments filiform, free, but cohering at the base with the petals into a ring; outer ones sterile (f. 126. g). — Anthers of the fertile ones ovate and bilocular. Style filiform; stigma capitate (f. 126. a), obscurely 4-toothed. Berry globose (f. 126. d), covered by the fleshy calyx, and crowned by its lobes, pulpy, many-seeded, 4-celled (f. 126. e) when young, Seeds oval, compressed. — East Indian herbs or trees, with alternate, feather-nerved, dotted, glabrous leaves; and large flowers with white petals, and red or yellow stamens.

1 C. herbaecea (Roxb. 1. c. t. 217.) herbaceous; leaves on short petioles, obovate-cuneate, serrated; racemes short; flowers pedunculate; outer filaments sterile, exceeding the fertile ones.

1 S. Native of Bengal. Berry an inch in diameter. Leaves 4-5 inches long. Petals white. Stamens red. (f. 126.)

2 C. arboræ (Roxb. 1. c. p. 14. t. 218.) arborescent; leaves on short petioles, obovate-cuneate, hardly serrated; spikes terminal, few-flowered; flowers sessile; outer filaments sterile, but not equal in length to the fertile ones. S. Native of the East Indies, in mountain valleys. Berries 4 inches in diameter, yellowish inside. Leaves 6-12 inches long. Petals yellowish. Stamens reddish.

Tree Careya. Clt. 1823. Shrub 6 to 10 feet.

3 C. macrostachytha (Jack, in mal. misc. 1. no. 2. p. 47.) arborescent; leaves petiolar, obovate, rather serrated; racemes lateral, nodding, densely many-flowered; flowers sessile, in many series. S. Native of Pulo-Pinang. The inflorescence is different from those of the other species. Ovarium 4-celled; cells 4-ovulate.

Long-spiked Careya. Tree 20 feet.

4 C. spilæca (Roxb. b. 3. p. 52.) S. Native of the East Indies. This species is not described.

Spherical-fruited Careya. Shrub 3 to 4 feet.

Cult. Careya is a genus of fine shrubs and trees, with showy flowers. Their culture and propagation are the same as that for Gustavía, p. 870.

1 C. nitida (Jack, l. c.) leaves obovate. S. Native of the higher mountains of India, particularly on the Sugar-loaf Mountain, in the interior of Bencoolen, where the leaves are used by the natives in place of tea.

Shining-leaved Gephyria. Tree 10 to 20 feet.

2 C. serrata (Jack, l. c.) leaves lanceolate, acuminate. S. Native of Pulo-Pinang, and on the west coast of Sumatra. Calyces, peduncles, bractlets, and young leaves silky. Petals and cells of ovary 5-6 in number.

Silky Gephyria. Tree.

Cult. For culture and propagation see Gustavía, p. 870.

XLIV. CROSSOSTYLIS (xroosos, krossos, a fringe, and ιπόλος, stylos, a style; in reference to the lobes of the stigma, which are fringed). Forst. gen. t. 44. Juss. gen. p. 432.

Lin. syst. Icosandria, Monogyinia. Calyx quadrangular, adnate to the ovary at the base, 4-cleft beyond the middle, permanent. Petals 4, unguiculate, alternating with the calycine lobes. Stamens about 20; filaments connate at the base into a ring, interspersed with many sterile, small hairs. Style 1, filiform. Stigma cleft into 4-lobed; lobes fimbriately trifid at the apex. Berry half superior, hemispherical, with many stripes,
1-celled, many-seeded. Seeds numerous, small, fixed to the central placenta.

1 C. bitiára (Forst. l. c.). 7. S. Native of the Society Islands. The rest unknown.

Two-flowered Crossostylis. Tree.
Cult. For culture and propagation see Cestàccia, p. 870.

LIN. Syst. Icosándria, Monogynìa. Tube of calyx adhering to the ovarium; limb small, 4-cleft, obtuse. Petals 4, coriaceous. Stamens numerous, inserted in a square disk; filaments joined into 5 series at the base; inner ones very short; anthers kidney-shaped, small. Style wanting. Stigma cruciate, hidden by the incurved stamens. Drupe ovate, 8-furrowed, crowned by the calyx; nucleus oblong.—A tall, hardly branched tree. Leaves very long, oblong, entire, cuneated at the base, on short petioles. Flowers large, white. Peduncles short, many-flowered. This genus is said to belong to Myrtaceæ by Sir J. E. Smith, but it appears to be much more nearly allied to Guttiferae.

1 G. calyéfìfìra (Lin. spec. p. 732). 7. S. Native of Jamaica, in subalpine, boggy places, where it is called Anchovy pear. Sloan. hist. 2. p. 123. t. 217. f. 1-2. leaf. Brown, jam. p. 245. Lunan. Hort. Jarn. 1. p. 19. The leaves are 2-3 feet long. The berry is ovate and crowned by the calyx, about the size and shape of an alligator’s egg, of a brownish russet colour; it is pickled and eaten like the mango, which it greatly resembles in taste. It is readily propagated by seeds, and the plants must be kept in a moist heat. To grow it for fruit, plant in a border, and train horizontally near the light.

Semi-flowered Grias or Anchovy-pear. Clt. 1768. Tree 20 to 50 feet.
Cult. This tree grows best in loamy soil; and large cuttings succeed best under a hand-glass, in heat.

Calyx superior, 2 or 6-leaved, or urceolate, with a divided limb (f. 127. a. f. 128. a.); valvate, or imbricate in aestivation. Corolla of 6 unequal petals, cohering at the base, with an imbricated aestivation. Stamens indefinite, epigynous, connected into a single petaloid, cucullate, unilateral body (f. 127. l. f. 128. c.). Ovary inferior, 2-6-celled; ovula indefinite, or definite, attached to the axis; stigma simple. Fruit a woody capsule (f. 127. i. f. 128. f.), either opening with a lid or remaining inclosed. Seeds several, covered by a thick integument. Embryo without albumen, either undivided, or with 2 large, petaloid, fleshy, or leafy cotyledons, sometimes folded upon the radicle, which is next the hynum.—Large trees, with alternate, entire, or toothed leaves, with minute, deciduous stipula, and without pellicid dots. Flowers large, terminal, or lateral, solitary, or racemose. This order has been combined, by de Candolle and others, with Myrtaceæ, from which it differs most essentially in their alternate, often serrated leaves, without pellicid dots.

The fruit of Couroupita Guianensis, called in Guiana Abicrot sauvage, in Cayenne is vinous and pleasant. The most gigantic tree in the ancient forests of Brazil is that called the Jaca-pu-caya; it is the Lécythis ollaria, the seeds of which are large and edible. Pr. trav. p. 83. The fleshy seeds of most of the species of Lécythis are edible, but some of them leave a bitter unpleasant after-taste in the mouth. The bark of Lécythis ollaria is easily separable by beating the liber into a number of fine distinct layers, which divide so neatly from each other, that when separated they have the appearance of thin satiny paper. Poiteau says that he has counted as many as 110 of these coatings. The Indians cut them in pieces as wrappers for their eigars. The well-known Brazil nuts of the shops of London are the seeds of the Bertholletia excelsa. The lacerated parts of the flowers of Couroupita Guianensis become blue upon exposure to the air.

Synopsis of the genera.

Lécythis. Limb of calyx 6-lobed. Staminiferous ligula bearing the anthers at the base, and the sterile filaments at the apex on the inside. Ovarium 2-6-celled, many-ovulate. Capsule opening by a lid.

Eschweileria. Limb of calyx bent back and applied to the tube, and more or less adnate to it. The rest as in Lécythis.

Couroupita. Calyx and corolla as in Lécythis. Ovarium 6-celled. Capsule with the lid not separable.

Courartari. Limb of calyx 6-parted. Petals 6, joined at the base. Stamineous ligula unilateral, and antheriferous inside. Fruit 3-celled, but at length 1-celled, with a convex lid, which is formed from the dilatation of the top of the central column.

LIN. Syst. Monadelphìa, Polygynìa. Tube of calyx tubinatis; limb 6-lobed, permanent (f. 127. a.). Petals 6, unequal. Staminiferous ligula (f. 127. l.) bearing the anthers at the base, and the sterile filaments at the apex on the inside. Ovarium 2-6-celled; cells many-ovulate. Style short. Capsule coriaceous or woody, circumcised at the apex, and therefore opening by a lid at the top (f. 127. b.). Seeds few or solitary in each cell ovate-oblong, fixed to the central column at the base, covered by a fleshy membrane. Embryo undivided. Cotyledons thick, closely conferruminated.—Trees nearly all glabrous. Fruit large, tubinatis, or globose. Seeds edible. Numbers of the species are not well known.

* Leaves serrated.

I. Ollaria (Lin. spec. p. 734.) leaves sessile, serrated, cordate-ovate; racemes terminal; fruit roundish. 7. S. Native of Cumania, in fields, ex Lœfl. litn. p. 159.; and of Brazil, if the Jaca-pucaya, Maregr. bras. p. 128. be the same. Pins. bras. p.135. with a figure. The tree is called at Barcinoma Ollata. Fruit the size of a child’s head, according to Maregraff. Corolla white, with a yellow nectary. The seeds are like chestnuts, eatable either raw or roasted. The bark of the tree serves to make ink.
**Lecythidiaceae. I. Lecythid.**

Ollata Cannon-ball-tree. Tree 10 to 60 feet.

2 L. minor (Jacq. Amer. p. 168. t. 100.) leaves petiolate, serrated, lanceolate-oblong; racemes terminal; fruit globose. \( \ast \). S. Native in the woods of Carthagena, especially about La Quinta. Flowers large, sweet scented, white, but with the strap of the stamens yellow. Fruit 2 inches in diameter. Seeds catile, and with a very agreeable taste. Monkeys are said to be extremely fond of them.

**Smaller Cannon-ball-tree.** Cited 1825. Tree 60 feet.

3 L. lanceolata (Poir. dict. p. 27.) leaves petiolate, serrated, lanceolate, acuminate; racemes lateral; fruit ovate. \( \ast \). S. Native of Brazil, whence it has been introduced to Madagascar and the Mauritius. Flowers smaller than those of the first species. Pedals very blunt, nearly equal. Fruit large.

**Lanceolate-leaved Cannon-ball-tree.** Tree.

4 L. elliptica (H. B. et Kunth, nov. gener. Amer. 7, p. 259.) leaves petiolate, elliptic, short-acuminated, rounded at the base, dentately crenated; racemes straight; petals obtuse. \( \ast \). S. Native of South America, on the banks of the river Magdalena, near Moraes. Fruit unknown.

**Elliptic-leaved Cannon-ball-tree.** Tree.

5 L. d'ubia (H. B. et Kunth, l. c.) leaves oblong, acuminate, narrowed at the base, obsolete toothed. \( \ast \). S. Native on the banks of the river Magdalena. Flowers and fruit unknown.

**Double-flowered Cannon-ball-tree.**

6 L. longifolia (H. B. et Kunth, l. c.) leaves petiolate, lanceolate, acuminate, acute at the base, obsolete and remotely toothed, conduplicate. \( \ast \). S. Native of South America, where it is called Cocoes de mono. Flowers and fruit unknown.

**Long-leaved Cannon-ball-tree.**

*FIG. 127.*

**Leaves quite entire.**

7 L. grandiflora (Aubl. guian. 2, p. 712. t. 283, 284, and 285.) leaves petiolate, oval, acute, quite entire, stiff; racemes axillary and terminal; pedicels thick, shorter than the largest petal; fruit ovate, nearly globose; operculum acute. \( \ast \). S. Native of Cayenne, in woods, where it is called, as well as several other species, Canari Macaque and Marmite de singe. L. ollaria, Lin. amm. but not of his spec. pl. according to the Linnaean herbarium, ex Smith, in Rees' cyc. 20. no. 1. Leaves glabrous on both surfaces, rather velvety beneath when young. Pedicels thick. Flowers 2 inches in diameter. Petals deep red, very hard. Fruit 4-5 inches in diameter. Seeds catile and very palpable.

**Great-flowered Cannon-ball-tree.** Cited 1825. Tree 60 to 80 ft.

8 L. coriacea (D. C. prod. 3, p. 291.) leaves on short petioles, oval, acutish, quite entire, stiff, glabrous on both surfaces; panicles axillary and terminal; pedicels slender, about the length of the flowers. \( \ast \). S. Native of Brazil, in the province of Rio Negro. Consistence and nervation of leaves nearly as in L. grandiflora, but the flowers are 3-times smaller. Fruit unknown.

**Coriaceous-leaved Cannon-ball-tree.**

9 L. idatimus (Aubl. guian. 2, p. 751. t. 289.) leaves on short petioles, ovate-lanceolate, acuminate, quite entire; racemes axillary and terminal; pedicels slender, longer than the flowers; petals obvate; fruit nearly ovate, depressed, 4-celled. \( \ast \). S. Native of Guiana, in woods, at the river Sincanari, and of Brazil, in Maranham, and the province of Para. Flowers rose-coloured. Fruit an inch in diameter. The leaves in the Brazilian specimen are less intensely reticulated than in the Guiana plant. Perhaps L. rufa is a variety of this species, only differing in the colour of the flowers.

**Idatimus Cannon-ball-tree.** Cited 1825. Tree 60 feet.

10 L. longipes (Poir. mem. mus. 13, p. 144. t. 2.) leaves petiolate, oblong, quite entire, abruptly acuminate; racemes terminal, loose, pendulous; fruit ovate, depressed, 2-celled. \( \ast \). S. Native of Cayenne, at Mount Maliari. Flowers violaceous. Fruit violaceous, with a white lid, 18-24 lines in diameter.

**Var. \( \beta \), platycarpa (Poir. l. c.) fruit large, depressed; flowers smaller, pendulous. \( \ast \). S. Native of Cayenne, at Savanna Baduel. Perhaps a proper species.

**Long-petioled Cannon-ball-tree.** Tree 20 to 30 feet.

11 L. pedicellaris (D. C. l. c.) leaves on short petioles, oblong, gradually acuminate, quite entire; pedicels terminal; pedicels slender, length of corolla. \( \ast \). S. Native of Brazil. Intermediate between L. longipes and L. corrugata, but the colour of the flowers and fruit is unknown; it however differs from the first species in the leaves being not abruptly but gradually acuminate, and in the flowers being smaller; and from the second in the pedicels being 6-times longer than the flowers; and from both in the l.bes of the calyx being oval-oblong, not roundish.

**Pedicelled-flowered Cannon-ball-tree.**

12 L. acuminata (D. C. l. c.) leaves on short petioles, quite entire; calyx abruptly acuminate, rather membranous; pedicel elongated, sparingly branched at the base; pedicels slender, length of the corolla. \( \ast \). S. Native of Brazil, in the province of Rio Negro. This species is allied to L. longipes and L. pedicellaris in the elongated pedicels, but differs from the first in the leaves being oval, not oblong, and in the racemes being erect, not pendulous, &c., and from the second in the leaves being abruptly, not gradually acuminate. Fruit unknown.

**Acuminate-leaved Cannon-ball-tree.**

13 L. subflora (Ruiz et Pav. fl. per. 4. t. 461.) leaves petiolate, oblong-lanceolate, quite entire, acuminate; pedicels 1-flowered, usually 2-together; petals obtuse. \( \ast \). S. Native of Peru.

**Somewhat-two-flowered Cannon-ball-tree.**

14 L. albiflora (D. C. l. c.) leaves petiolate, oval, acute or acuminate, rather coriaceous, quite entire; panicle terminal, with its branches angular; pedicels longer than the corolla; petals rather unequal. \( \ast \). S. Native of Brazil, in the province of Para, at the Rio Negro, in woods. Lecythis, Mart. herb. Flowers white, nearly like those of L. idatimus. Fruit unknown. Leaves less coriaceous, but much more reticulated than in L. idatimus.

**White-flowered Cannon-ball-tree.** Tree 60 feet.

15 L. corriguata (Poit. mem. mus. 13, p. 145. t. 3.) leaves petiolate, oblong, acute, coriaceous, quite entire; panicle terminal, erect; flowers on very short pedicels; fruit turbinate, 4-celled, corrugated. \( \ast \). S. Native of Guiana, along the river La Mann. Flowers rose-coloured. Fruit an inch in diameter, girded by the calyx, deeply corrugated by transverse wrinkles. (f. 127.)

**Corrugated-fruited Cannon-ball-tree.** Shrub 6 to 10 feet.

16 L. zabuccago (Aubl. guian. 2, p. 719. t. 288. and t. 284.) leaves petiolate, lanceolate-oblong, acuminate, quite entire; racemes terminal; pedicels rather shorter than the flowers; petals acute; fruit ovate. \( \ast \). S. Native of Guiana, in woods, where it is called by the natives Quantélé and Zabucajo. Petals very

---

Vol. II.
white, edged with rose-colour, nearly equal. Fruit 4 inches in diameter. Racemes nodding. Seeds edible, and preferable to our almonds.

Zalucojo Cannon-ball-tree. Tree 50 to 60 feet.

17. LECYTHIS. Pedicels short. Racemes terminal; pedicels shorter than the flowers; petals acute; fruit ovate, 4-celled. H. S. Native of Guiana, in woods. Fruit the size and form of an egg. Flowers small, yellow. Seeds bitter, but eaten by monkeys.

Bitter-seeded Cannon-ball-tree. Cl. 1825. Tree to 12 ft.

18. L. Pavia (Aubl. guian. 2. p. 717. t. 287.) leaves petiolate, oblong, acuminate, quite entire; racemes pedicelled, terminal; pedicels rather shorter than the flowers; petals acutish; fruit rather ovate, and somewhat 2-celled. H. S. Native of Guiana, on the banks of rivers. Flowers small, sulphur-coloured. Nucleus of seeds bitter. Fruit tender, not woody, 2-seeded.

Small-flowered Cannon-ball-tree. Cl. 1825. Shrub 4 to 6 ft.

19. L. Mancirotta (D. C. l. c.) leaves petiolate, oval, obtuse at the base, acute at the apex, or rather acuminate, quite entire; racemes sub-pedicellate; pedicels shorter than the flowers; sepals and petals very small. H. S. Native of Brazil. Leaves rather membranous, lateral nerves distant. Petioles 3-4 lines long. Flowers the size of those of L. Idatimn. Fruit unknown.

Oval-leaved Cannon-ball-tree. Tree.

† A species not sufficiently known.

20. L. MULTIFLORA (Smith in Rees' cycl. vol. 20. no. 8.) leaves unknown; racemes terminal, pedicelled; petals obuse; calyces lobes tormentose. H. S. Native of Guiana. Flowers apparently yellow.

Many-flowered Cannon-ball-tree. Tree.

Cult. All the species of Lecythis require a strong heat. A mixture of loam and sand is the best soil for them. Ripened cuttings will root if planted in sand with a hand-glass over them, in a strong heat.

II. ESCHWELEIRA (evidently named after some person of the name of Eschweiler). Mart. ms. ex D. C. prod. 3. p. 293.

Lin. Syst. Monandria, Polyandria. All as in Lecythis, but differs in the limb of the calyx being bent back upon the tube, and more or less adnate to it. Perhaps only a section of Lecythis.

1. E. Pavia (Mart. ms. ex D. C. l. c.) leaves ovate, gradually acuminate, coriaceous, quite entire; lateral nerves hardly distinct, never elevated. H. S. Native of Brazil. Zabucajo, Pison, bras. p. 66. with a figure. Panicule terminal. Pedicels very short. The fruit agrees with that of Lecythis corvignata, but is much more turbinate at the base, and the limb of the calyx is 6-lobed and folded back upon the tube.

Small-flowered Eschweileria. Tree 40 feet.

2. E. Grandiflora (Mart. herb. ex D. C. l. c.) leaves oblong-lanceolate, obtuse at the base, acuminate at the apex, stiffish, with quite entire margins; lateral nerves distinct, elevated beneath. H. S. Native of Brazil, in the province of Para. Leaves almost like those of Lecythis Zabucajo, Aubl. t. 288. but they are less reticulated. Fruit globose, with a very blunt lid.

Great-flowered Eschweileria. Tree.

Cult. For culture and propagation see Lecythis.

1. B. Excelsa (Humb. et Bonpl. l. c.) H. S. Native of South America, spontaneous in woods on the banks of the Orinoco, and now cultivated in Brazil, Guiana, &c. H. B. et Kunth, nov. gen. amer. 7. p. 260. Rich. anal. fr. p. 74. and Tonka. Rich. ibid. p. 84. The triangular seeds known by the name of Brazil-nuts in our shops are the produce of this tree. The tree is said to be originally from the province of Para in Brazil, and is said also to form forests on the borders of the Orinoco. The almonds or nuts have been known to the Portuguese for a very long time, and are now known in all parts of Europe; in France under the name of Chastignes du Brésil; in Spain under that of Almandron; in Portugal under Castanas de Maranon; in England under the name of Para-nuts or Brazil-nuts. The natives of the country call them Juvia, the Brazilians Capueaya. The Portuguese at Para carry them to Cayenne and Maranham, and sell them under the name of Tuka. The capsule or fruit is as large as a large cannon-ball, containing many triangular nuts, laid over each other in a regular manner. An oil is prepared from them, as well as from the seeds of several species of Lecythis, which is in great request in Brazil.

Tall Bertholletia or Brazil-nut. Tree 100 to 150 feet.

Cult. For culture and propagation see Lecythis.

Lin. Syst. Monandria, Polyandria. Calyx and corolla of Lecythis. Staminal flowers furnished with anthers, both at the base and apex. Ovarium turbinate, 6-celled. Parietal dissepiments reflexed towards the axis, and stretched even to the column; funicles concrete among themselves, and therefore bearing many ovula. Style wanting. Stigma stellately hexagonal. Capsule crustaceous, globose, rounded by the calyceine circle, valveless, pulp inside. Ovules not separable. The pulp before the fruit is ripe is fleshy, but after deliquescence it vanishes, and at length the endocarp is separable from the epicarp. Seeds imbedded in the pulp, numerous, ovate, covered by a coriaceous villous membrane. Embryo roundish, compressed, beaked. Cotyledons large, folicaceous, nerved, plicate, corrugated, curved under the club-formed radicle.—Trees. Leaves petiolate, oblqong-cunetted, rather crenulated. Stipulas small, caducous. Racemes simple, rising from the trunk and
branches, bracteate. Flowers large, of a dirty whitish or flesh-colour.

1 C. Guianensis (Anbl. guian. 2. p. 708. t. 282.) leaves acute; edge of calyx circumcised; petals acute. ț S. Native of Guiana and Cayenne, in sand by the sea side, where it is called Couroupitoutoumou, ex Barrere; Abricot sauvage, ex Aublet; Calebassè-colin, ex Poit. Fruit larger than a head, and consequently called bouquet de canon or cannon-ball. Tuss. ant. 2. p. 43. f. 20-11. Lécythis bracteata, Wild. Pêkea Couroupita, Juss. Pulp of fruit vinous. Flowers flesh-coloured, size of those of Lécythis grandiflora, sweet-scented. The pulp of the fruit is white, acid, and not disagreeable.

Guiana Cannon-ball-tree. Clt. 1820. Tree 50 to 100 ft.

2 C. Nicaraguarenensis (D. C. prod. 3. p. 294.) leaves obtuse; margin of calyx lobed; petals obtuse. ț S. Native of South America, near Nicaragua. Lécythis Nicaraguarenensis, Moc. et Sesse, fl. mex. icon. ined. Differ from the first in the flowers being smaller, of a dirty whitish brown-colour, and in the pulp of the fruit being bluish.

Nicaragua Cannon-ball-tree. Tree 40 to 50 feet.

Cult. For culture and propagation see Lécythis, p. 874.

LIN. SYST. Monadelphia, Polyandria. Tube of calyx turbinate; limb 6-parted. Petals 6, joined at the base. Stamens numerous; filaments concreting into an urceolated concave truncate unilateral ligula, bearing the anthers on the inside. Ovary 3-4-celled; cells 4-ovulate; ovulis erect. Style subulate, simple. Fruit or pyxidium oblong, somewhat trigonal, 3-celled, but at length becoming 1-celled, coriaceous, valveless, closed; operculum convex, formed from the central dilated column. Seeds oblong-lanceolate, numerous, disposed in 3 bundles in the bottom of the fruit. Embryo conduplicate, with a long root. Cotyledons 2, long, foliaceous, corrugated. Radicle incumbent.—Trees. Leaves alternate, extipulate, quite entire. Racemes axillary, spicate.

1 C. Guianensis (AUBL. 1. c. t. 290.) fruit somewhat tetragonal, with the orifice entire; seeds girded by a wing. ț S. Native of Guiana, near Aroura, at the river Sinemari, where it is called couratari, maou, and baluta blanc. Rich. 1. c. t. 21. good. The inhabitants of Guiana form cordages of the bark of this tree.

Guiana Couratari. Tree 60 feet.

2 C. Estrellaenis (Raddi, mem. pl. bras. add. p. 25. f. 2.) fruit nearly cylindrical, with a lobate orifice; seeds acute upwards. ț S. Native of Brazil, on the mountains of Estrella. Flowers unknown.

Estrella Couratari. Shrub 6 to 10 feet.

Cult. For culture and propagation see Lécythis, p. 874.
